Background: This study evaluates Matrix Rhythm Therapy (MRT) alongside traditional massage to assess their impact on peripheral circulation. While massage therapy is widely used to enhance blood flow and tissue healing, the effectiveness of MRT in this regard remains unclear. By comparing these modalities, the study aims to provide clarity on their therapeutic benefits, potentially guiding treatment choices in clinical practice. **Methods:** A systematic review following PRISMA guidelines will compare Matrix Rhythm Therapy (MRT) and traditional massage effects on peripheral circulation. Studies will be assessed using PEDro score and CEBM's Level of Evidence scale. Data synthesis, including potential meta-analysis, aims to inform clinical decisions on therapeutic interventions for peripheral circulation. **Results:** Matrix Rhythm Therapy (MRT) demonstrated significant efficacy across various conditions, including pain reduction, enhanced functional activities, and improved quality of life. Studies highlighted its effectiveness in addressing chronic low back pain, peripheral circulation, diabetic peripheral neuropathy, and hand pain in excessive smartphone users. While some comparisons favored alternative treatments like stretching exercises for specific conditions, overall, MRT emerged as a promising therapeutic modality with broad applicability in healthcare settings. **Conclusion:** Matrix Rhythm Therapy (MRT) shows significant promise in addressing a wide range of conditions, offering pain relief, improving functional outcomes, and enhancing quality of life.

KEYWORDS

Musculoskeletal disorder, Matrix Rhythm Therapy, Systematic review, pain reduction.

INTRODUCTION

Background

Patients experiencing musculoskeletal issues often activate anaerobic metabolism due to reduced blood circulation and microcirculation. The compromised regulation of microcirculation in muscles is associated with the generation of nociceptive pain. Circulation plays a crucial role in tissue healing, with enhanced blood circulation facilitating the delivery of proteins, nutrients, and oxygen, consequently promoting improved tissue healing Recent studies have focused on comparing the efficacy of various conservative treatment approaches on bloodstream dynamics.[1,2,3]

Massage, a widely adopted physiotherapeutic technique, is employed to enhance blood circulation. Defined as soft tissue manipulation for therapeutic purposes, massage therapy is administered by trained therapists. While some sports medicine practitioners advocate for the benefits of massage, including increased blood circulation, reduced muscle tension, and enhanced neural excitability, conflicting opinions exist in the literature. Some authors posit that massage positively impacts blood circulation, while others assert that it has no effect.[4,5,6,7]

Various massage techniques, such as effleurage, petrissage, tapotement, friction, and vibration, are employed.[8] Vibration massage, specifically, aims to enhance circulation and facilitate muscle relaxation. Mechanical devices allow for the safe and localized application of vibration treatment. Adjustable speed and frequency in vibration devices cater to diverse indications, with some used in beauty salons for fat burning, hand-held devices for musculoskeletal pain, and whole-body vibration devices for exercise.[9]

While hand-held devices exhibit a strong placebo effect, low-magnitude mechanical vibration is believed to boost local blood flow. Matrix Rhythm Therapy (MRT) represents a novel form of vibromassage utilized in various settings, including special education and rehabilitation centers, sports clubs, and neurologic, orthopedic, physical therapy, and rehabilitation centers.[10,11,12]

Limited studies and clinical experiences suggest the effectiveness of MRT, yet the evidence level is considered low. To elucidate the therapeutic efficacy of MRT, it is imperative to explore its impact on peripheral circulation. [13]As MRT is a novel vibromassage method, no studies have yet assessed its influence on circulation, and existing literature presents conflicting results regarding the effect of massage on peripheral circulation[14]. Notably, MRT requires a device for application, distinguishing it from traditional massage methods. If the findings of the current study reveal comparable increases in peripheral blood circulation between massage and MRT, it may suggest a preference for traditional massage over MRT. This approach deviates from previous studies that compared MRT to a placebo, as therapists have shown a preference for manual hand massage over handheld devices.[15]

MRT represents a groundbreaking approach in cellular therapy, utilizing rhythmic oscillations within the 8-12 Hz range to rejuvenate cellular energy metabolism and rebalance physiological functions.[16] By intricately stimulating cells and synchronizing tissue, it promotes heightened circulation, increased oxygenation, and enhanced ATP synthesis, fostering deep-seated muscle and tissue relaxation. This advanced technique orchestrates cellular regeneration and healing through precise micro-process modulation, ensuring enduring relaxation and optimized tissue metabolism, thereby offering comprehensive therapeutic benefits at the cellular level.

METHODOLOGY

Study Duration

6 - 8 Month.

Study Design

This will be an Evidence Based Study and will conduct according to PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-analysis) guidelines.

Figure 7: Flowchart for PRISMA

Figure 8 : Flowchart for Review Article

Inclusion Criteria

1. Articles published during last 10 years. (2012- May 2022)
2. Articles having study design as Systematic reviews, Meta-analysis and Randomized controlled trial.
3. Articles published in English.
4. Articles in which studies done on Human.

Exclusion Criteria

1. Articles having study design as case control or cohort.
2. Studies done on animals.
3. Studies design case reports.

Data Analysis

- ❖ Physiotherapy Evidence Database (PEDro)
  - ➢ It assesses methodological quality and consists of a checklist of 11criteria, 10 of which are scored.
  - ➢ For each criterion the study met, 1 point was awarded.
  - ➢ The points were presented as a score out of 10.
  - ➢ PEDro scores of 6 to 10 were considered high quality, of 4 to 5 were considered moderate quality, and of 0 to 3 were considered low quality

- ❖ Centre for Evidence-Based Medicine's (CEBM's) Levels of Evidence scale:
  - ➢ It assesses quality based on study design, which categorize the studies in a scale ranging from 1 to 5 with further subdivision for each.

Figure 09: Hierarchy of Evidence

RESULTS

The review article synthesized findings from multiple studies on Matrix Rhythm Therapy (MRT), highlighting its diverse applications and therapeutic efficacy across various pathological conditions. Dr. Sonali Shrivastava's review emphasized MRT's ability to induce oscillations within the physiological frequency range, thereby restoring disrupted rhythms at the cellular level and enhancing oxygen supply, leading to tissue relaxation and pain reduction.

Dr. med. Ulrich G. Randoll underscored MRT's successful application in rehabilitation, sports medicine, and veterinary medicine, noting its role in preventive measures and rehabilitation efforts, as well as its effectiveness in addressing various types of pain and degenerative diseases.

Nadir et al.'s study focused on chronic low back pain and found that MRT, when integrated into a comprehensive physiotherapy program, led to significant improvements in pain, disability, and quality of life compared to the control group.

Taspinar et al.'s research demonstrated MRT's ability to enhance peripheral blood circulation, particularly in young women, compared to massage therapy.

Figure 10: PEDro Score

- We have taken PEDro score for our study for MRT and concluded that approximately 76.8% of study from 2012 to 2023 were shows that MRT is more beneficial than conventional therapy.
- Evidence shows that MRT is more effective compare to conventional therapy such as Non-healing wounds, Arthritis, Osteoporosis, Spasticity, Ligaments tear, Tendinitis and Bone degeneration.

DISCUSSION

1. The study by F Taspinar et al. in the year (2013), "engages with the outcomes derived from a randomized, double-blind, controlled trial, investigating and contrasting the effects of matrix rhythm therapy and massage on peripheral blood circulation" in a cohort of fifteen healthy women aged 19–23 years. The interventions, administered as single 30-minute sessions on the left lower extremity with a minimum one-week interval, were executed by the same physiotherapist.[17]
2. Derya et al. in Dec, (2016), investigates "the comparative short-term effectiveness of Matrix Rhythm Therapy and stretching exercises in individuals with frozen shoulder." Forty-three patients, with an average age of 52.6 years, were randomly assigned to either the Matrix Rhythm Therapy or stretching exercises group, both undergoing a 6-week treatment accompanied by a similar home exercise program. Various outcome measures, including range of motion, Constant score, Disabilities of the Arm, Shoulder, and Hand score, Short Form Health Survey-36, and Global Rating of Change score, were assessed at different intervals.[18]
3. T. Palekar in the year (2019), proposes "Matrix Rhythm Therapy (MRT), an emerging electrotherapy modality, demonstrating effectiveness in managing pain and restoring cellular frequency" within the 8-12Hz range. This study focuses on evaluating the impact of MRT on hand pain in excessive smartphone users.[19]
4. Dr. Sonali Shrivastava's review (2019) highlights that "Matrix Rhythm Therapy induces oscillations within the physiological frequency range of 8-1 HZ. This frequency synchronization with the body aims to restore disrupted rhythms at the cellular level." The therapy demonstrates a positive impact on oxygen supply by enhancing microcirculation, consequently boosting energy production. Notably, immediate effects manifest as the relaxation of tissues, muscles, and fascia, with this relaxation enduring for an extended period.[20]
5. Dr. med. Ulrich G. Randoll (2019) underscores "the successful application of Matrix-Rhythm-Therapy, particularly in the realms of rehabilitation, high-performance sports, and veterinary medicine." The therapy has undergone rigorous testing and validation over the past decade, originating from the University of Erlangen. Its application is particularly noteworthy for both preventive measures, involving the prophylactic avoidance of disease development, and rehabilitation efforts, aimed at preventing and mitigating damages resulting from strain, trauma, accidents, and surgeries. Sports medicine, in particular, recognizes the therapy's merit in significantly expediting the regeneration time between training periods, especially after instances of hyper-distension, injuries, hardening, tendonitis, and other impairments. This acceleration allows for the intensification of training cycles and facilitates a swifter return to peak performance following injuries.[21]
6. In the experimental study published in (2019), by Naik et al., aimed to assess "the effectiveness of a single session of Matrix Rhythm Therapy (MaRhyThe) in individuals diagnosed with Plantar Fasciitis (PF), a prevalent musculoskeletal condition often associated with limitations in daily activities." Seventeen subjects within the age range of 18-35 years participated in the study, receiving one session of MaRhyThe targeting the calf and plantar aspect of the foot, lasting 45–60 minutes. The pre and post-intervention outcomes were measured using a pressure algometer (PPA) for pain assessment, a non-contact infrared thermometer (IRT) for local skin temperature, and the Foot and Ankle Ability Measures (FAAM) scale for evaluating functional activities.[22]
7. Nadir et al. (2021) assess "the impact of Matrix Rhythm Therapy (MRT) on chronic low back pain, specifically concentrating on parameters such as pain intensity, levels of disability, and overall quality of life." A cohort of thirty-two participants underwent random assignment into either the intervention or control group. Both groups underwent a comprehensive ten-session combined physiotherapy program, with the intervention group receiving an additional six sessions of MRT.[23]
8. Anand et al. (2022) proposes diabetic peripheral neuropathy (DPN), a prevalent complication of diabetes, adversely impacting the quality of life by affecting balance and gait, leading to an increased risk of falls. Matrix Rhythm Therapy (MaRhyThe) is an innovative approach utilized in various musculoskeletal and neurological conditions to manage pain and enhance functionality.[24]
9. Taj Afreen Sheikh (Oct, 2022) underscores "the Matrix Rhythm Therapy (MRT) approach in the fundamental understanding that cellular processes, whether preventive, therapeutic, regenerative or degenerative, operate predominantly within the cellular environment." Crucial to these processes is the muscle pulsation frequency, identified at 8-12 Hertz, with deviations outside this range linked to ailments such as aches, muscle tension and broader health concerns.[25]
10. The study by Munjewar et al. in the year (2022), examines "the effectiveness of Matrix Rhythm Therapy (MRT) as a novel development in physiotherapy." MRT serves as a non-invasive method for relieving pain, enhancing microcirculation, promoting relaxation, and increasing blood oxygenation. Operated within a frequency range of 8-12 Hz, MRT stimulates the body's self-healing powers, employing vibromassage through a resonating head to release muscular tension.[26]

CONCLUSION

- MRT's non-invasive nature makes it a valuable therapeutic option with broad applications in musculoskeletal health, presenting opportunities for improved well-being.Matrix Rhythm Therapy (MRT) exhibits promising efficacy in managing various musculoskeletal disorders. Studies highlight its ability to induce physiological oscillations, restore disrupted cellular rhythms and enhance microcirculation, contributing to improved oxygen supply. Applications in rehabilitation, sports, and diverse musculoskeletal conditions demonstrate positive outcomes, including pain relief and functional improvements.
- Evidence shows that MRT is more effective compare to conventional therapy such as Non-healing wounds, Arthritis, Osteoporosis, Spasticity, Ligaments tear, Tendinitis and Bone degeneration.

Limitations

- Limitations of this study include potential constraints arising from the availability and quality of existing scientific data on Matrix Rhythm Therapy (MRT) in musculoskeletal disorders, as well as the heterogeneity of included studies in terms of design, participant characteristics, and outcome measures.
- The study's scope may be limited to the disorders covered in the available literature, potentially overlooking other musculoskeletal conditions.
- It includes other factors like patient comorbidities, and variations in practitioner expertise could act as confounders, influence on the effects of MRT.

ABSTRACT

Background: Plantar fasciitis is a prevalent condition affecting 10% of the general population, particularly active working adults aged 25 to 65. This study aimed to assess the efficacy of intrinsic and extrinsic muscle-strengthening exercises in individuals with plantar fasciitis, considering age-specific responses. **Methods:** A randomized controlled trial was conducted involving 30 participants (18 females, 12 males) aged above 18, distributed into Group-A (intrinsic exercises) and Group-B (extrinsic exercises) for a 4-week intervention. Age distribution mirrored the typical age range of plantar fasciitis patients. **Results:** In participants aged above 40, intrinsic exercises demonstrated a statistically significant improvement in foot function and pain reduction compared to extrinsic exercises. No significant differences were observed in participants below 40. Overall, intrinsic exercises showed superiority in both age groups. **Conclusion:** This study highlights the importance of tailoring exercise interventions for plantar fasciitis based on age. Intrinsic exercises, particularly for individuals above 40, proved more effective in enhancing foot function and reducing pain. These findings underscore the need for individualized rehabilitation plans and warrant further research to explore long-term effects and refine treatment strategies.

KEYWORDS

Planter Fasciitis, Ultrasound, Intrinsic Exercise, Extrinsic Exercise, Foot Function Index, Numeric Pain Rating Scale.

INTRODUCTION

BACKGROUND

- Plantar fasciitis is a prevalent source of heel pain among adults. The discomfort typically results from collagen degeneration, often mischaracterized as "chronic inflammation," occurring at the point where the plantar fascia originates on the medial tubercle of the calcaneus. This degeneration shares similarities with the persistent necrosis seen in tendonosis. Tendonosis is characterized by the loss of collagen continuity, heightened levels of ground substance (the connective tissue matrix), increased vascularity, and the presence of fibroblasts, in contrast to the inflammatory cells typically associated with the acute inflammation seen in tendonitis.[1,2]
- This condition commonly results from overuse, primarily attributed to repetitive strain causing micro-tears in the plantar fascia. However, it can also manifest due to trauma or a combination of various factors. Predisposing factors include pes planus, pes cavus, restricted ankle dorsiflexion, and abnormal pronation or supination. Pes planus may increase strain at the plantar fascia's origin, while pes cavus can impose excessive strain on the heel due to inadequate foot eversion and shock absorption.
- Tightness in the gastrocnemius, soleus, and other posterior leg muscles is frequently observed in individuals with this condition, potentially altering normal walking biomechanics. While around 50% of patients may exhibit heel spurs, these spurs are not the root cause but are often present. Plantar fasciitis is commonly associated with runners and older adults, with additional risk factors including obesity, heel pad atrophy, aging, occupations involving prolonged standing, and weight-bearing activities. Although there is an association with certain seronegative spondyloarthropathies, approximately 85% of cases do not have identifiable systemic factors.[3,4]

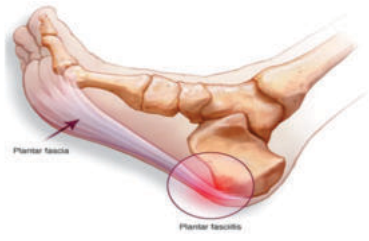

Figure 1: Diagram of Planter Fasciitis

Plantar fasciitis stands as the predominant cause of heel pain encountered in outpatient settings. While the precise incidence and prevalence across different age groups remain elusive, estimations suggest that approximately one million patient visits annually are attributed to plantar fasciitis. This condition contributes to around 10% of injuries related to running and necessitates professional medical care for 11% to 15% of all foot symptoms. It is believed to afflict approximately 10% of the general population, with the majority (83%) of affected individuals falling within the active working age group of 25 to 65 years. Bilateral presentation occurs in about a third of cases. Some literature indicates even higher prevalence rates, reaching up to 22%, particularly within populations of runners.[5,6]

- Management of plantar fasciitis involves a phased approach, with initial emphasis on conservative measures. Relative rest from the causative activity, tailored to the pain level, is recommended. Post-activity application of ice and the use of oral or topical NSAIDs can help alleviate pain.
- Patients are encouraged to modify work-related activities, and a night splint may be beneficial for those with persistent pain. Surgery is considered the final option and may involve fasciotomy through an open or endoscopic approach. However, it's important to note that surgical release does not guarantee a successful outcome. Potential complications include nerve injury, plantar fascia rupture, and flattening of the longitudinal arch. Careful consideration of the risks and benefits is imperative when contemplating surgical intervention for plantar fasciitis.[7,8,9]

Methodology

Study Place

OPD of Venus Institute of Physiotherapy, Bhoyan Rathod, Gandhinagar and Hi-Tech Multispecialty Hospital, Gandhinagar

Study Duration

4 weeks

Study Design

- Exprimental Study

Inclusion Criteria

1. Patients willing to participate
2. Both male and female subjects
3. Age between 25-60 years
4. Diagnosed with Plantar Fasciitis

Exclusion Criteria

1. Subjects with neurological disorders affecting the foot
2. Subjects with any previous heel or foot surgeries
3. Subjects with Peripheral Vascular disease
4. Subjects with pain at great toe and not around heel pain.

MATERIALS REQUIRED

Intervention

Intervention Group

1. Group A (Intrinsic Foot Muscle Strengthening + Ultrasound)
Participants will engage in a structured program including exercises such as toe curls, big toe extension *(Figure : 10)*, marble pick-up, towel gathering curls*(Figure : 9)*, toe spread, and tennis ball exercises. Each exercise is designed to target intrinsic foot muscles.
The intervention will include ultrasound therapy in addition to the exercise regimen.

2. Group B (Extrinsic Foot Muscle Strengthening + Ultrasound)
Participants in this group will follow exercises focused on extrinsic foot muscle strengthening, including calf muscle stretch*(Figure :5)*, resisted plantar flexion*(Figure : 6)*, foot supination-sitting, foot adduction, hip external rotation-side lying, and hip abduction.

Similar to Group A, participants in this group will receive ultrasound therapy *(Figure : 12)* as part of the intervention.

Exercise Protocol

Each exercise session will consist of 10–20 repetitions.
Participants will perform the exercises three times per day.

Figure 2 : Calf Muscle Stretching

Figure 3 : Resisted Plantar Flexion

Figure 4: Resisted Inversion Of Foot

Figure 5 : Abduction Of Foot Finger

Figure 6 : Towel Gathering (Curls) Exercise

Figure 7 : Big Toe Extension Exercise

Figure 8 : Big Toe Extension Exercise

Figure 9 : Apply Ultrasound Therapy

Outcome Measures

1. Foot Function Index (FFI) [13]

The FFI is a self-administered index comprising 23 items categorized into three subscales: pain, disability, and activity limitation. Participants rate each item on a scale from 0 (no pain or difficulty) to 10 (worst pain imaginable or requiring assistance) based on their foot condition over the past week. The pain subcategory consists of 9 items, disability subcategory consists of 9 items, and the activity limitation subcategory consists of 5 items. The FFI demonstrates good test-retest reliability for both total and subscale scores (ranging from 0.87 to 0.69) and high internal consistency (ranging from 0.96 to 0.73)

2. Numeric Pain Rating Scale (NPRS) [14]

The NPRS is a unidimensional measure of pain intensity in adults, comparable to the visual analogue scale (VAS). Administered verbally or graphically for self-completion, it employs a 10-point numeric scale ranging from 0 (no pain) to 10 (worst pain imaginable). Participants indicate the numeric value on the segmented scale that best describes their pain intensity. Higher scores signify greater pain intensity. The NPRS exhibits high test-retest reliability in literate and illiterate patients with rheumatoid arthritis (r=0.96 and 0.95, respectively). Additionally, for construct validity, the NPRS correlates highly with the VAS in patients with chronic pain conditions (ranging from 0.86 to 0.95). The scale provides a reliable and valid measure of pain intensity.

Data Collection

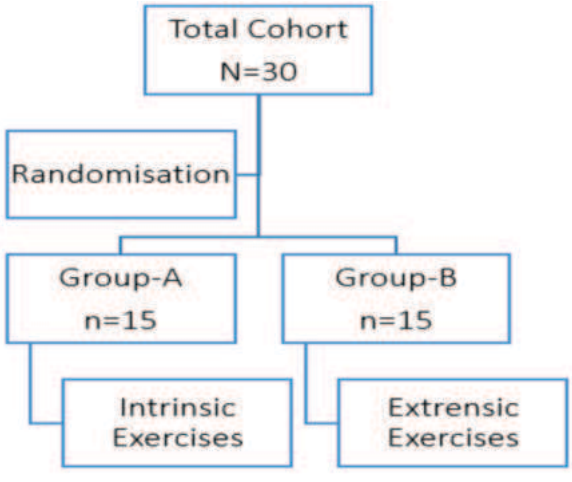
Data of all the patients were collected a data collection form.

Statistical Analysis

Descriptive statistics will be employed for demographic data, and inferential statistics will be used to compare changes in FFI and NPRS scores between the two intervention groups. The significance level will be set at $p < 0.05$.

RESULTS

This study involved a total of 30 patients diagnosed with plantar fasciitis were randomly allocated into two groups, Group-A and Group-B, each prescribed a distinct type of exercise regimen aimed at muscle strengthening—Intrinsic and Extrinsic, respectively—for a duration of 4 weeks. Among the total population, 18 patients were female and 12 were male, spanning ages from 18 to 59 years.



Baseline Characters

Table 1: Age group of Study Population

Age Group	Group-A		Group-B	
	Number	Percentage	Number	Percentage
20-29 Years	2	13.33%	2	13.33%
30-39 Years	6	40.00%	7	46.67%
40-49 Years	4	26.67%	6	40.00%
50-59 Years	3	20.00%	0	0.00%

The participant distribution across different age groups in Groups A and B, engaged in intrinsic and extrinsic exercises, respectively, reveals interesting insights. In the 20-29 age group, both groups have an equal representation of 13.33%. In the 30-39 age range, Group A constitutes 40.00% of participants, slightly less than the 46.67% in Group B. The 40-49 age group sees 26.67% in Group A compared to 40.00% in Group B. Notably, in the 50-59 age group, Group A has 20.00% representation, while Group B has none. These demographic variations underscore the importance of considering age differences in the interpretation of intervention outcomes, as the efficacy of intrinsic and extrinsic exercises may vary across different age cohorts.

Comparative Analysis of Group-A and Group-B

Table 2: Post-Baseline Full Set Descriptive Data (Group-A vs Group-B)

Post-Baseline Full Set Descriptive Data (Group-A vs Group-B)								
	Foot Function Index (FFI)				Numeric Pain Rating Scale (NPRS)			
	Group-A	Group-B	CFB	%CFB	Group-A	Group-B	CFB	%CFB
N	15.00	15.00	15.00	15.00	15.00	15.00	15.00	15.00
Minimum	90.00	120.00	11.00	10.09	3.00	4.00	0.00	0.00
Maximum	110.00	138.00	38.00	40.00	5.00	6.00	3.00	100.00
Mean	99.07	126.90	27.87	28.57	3.67	4.73	1.07	32.78
SD	6.46	5.66	7.90	9.09	0.62	0.80	1.03	33.85
SEM	1.67	1.46	2.04	2.04	0.16	0.21	0.27	8.74
P-value	<0.0001				<0.05			
Note: CFB- Change From Baseline/ %CFB- Percentage Change From Baseline								

In the post-baseline full set analysis comparing Group-A (Intrinsic Exercises) to Group-B (Extrinsic Exercises), significant differences are observed in both the Foot Function Index (FFI) and Numeric Pain Rating Scale (NPRS). In terms of FFI, Group-A exhibited a mean score of 99.07, significantly lower than Group-B's mean of 126.90, resulting in a substantial change from baseline (CFB) of 27.87 and a percentage change (%CFB) of 28.57%. This indicates that participants in Group-A experienced a more significant improvement in foot function compared to Group-B. In the NPRS, Group-A also showed a lower mean pain score of 3.67 compared to Group-B's 4.73, resulting in a CFB of 1.07 and a %CFB of 32.78%. While both groups experienced improvements in pain, Group-A demonstrated a larger reduction. The statistical significance for both FFI and NPRS differences is indicated by p-values of <0.0001 and <0.05, respectively. These results suggest that intrinsic exercises (Group-A) may be more effective in improving foot function and reducing pain compared to extrinsic exercises (Group-B).

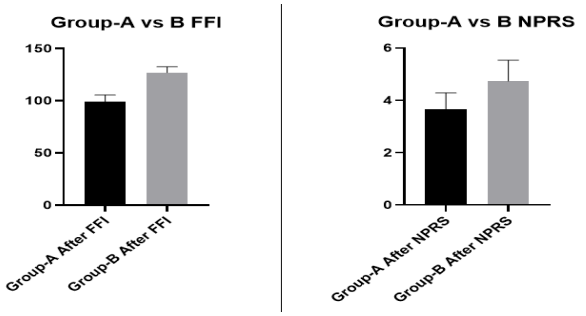

Figure 12: Post-Baseline Full Set Descriptive Data (Group-A vs Group-B)

DISCUSSION

Comparison with Previous Studies

The present study significantly contributes to our understanding of the relevance of intrinsic and extrinsic muscle strengthening in individuals diagnosed with plantar fasciitis [10]. The research cohort comprised a total of 30 participants, all above the age of 18, which aligns with the demographic characteristics of plantar fasciitis patients, a condition that notably affects around 10% of the general population. Within this demographic, a substantial majority consists of active working adults aged between 25 and 65 years, with a peak incidence occurring in the 40 to 60 years age range and a higher prevalence in women compared to men. Remarkably, a similar age distribution was observed in the present study, with the majority falling between the ages of 30 and 49[11].

Building on existing literature, a prior study involving 36 individuals focused on comparing the effectiveness of exercises targeting extrinsic and intrinsic foot muscles in enhancing the medial longitudinal arch, particularly in adolescents with flat feet. In this investigation, Group 1 engaged in intrinsic muscle exercises, while Group 2 performed extrinsic muscle exercises. The outcomes of this study resonate with the findings of the present research, where the group undertaking intrinsic exercises exhibited a statistically significant improvement compared to the group assigned extrinsic exercises for managing plantar fasciitis. These parallel results further support the notion that intrinsic exercises may be more effective than their extrinsic counterparts in addressing the complexities of plantar fasciitis. The implications of these findings are particularly relevant in informing targeted intervention strategies for individuals grappling with this prevalent foot condition [12].

CONCLUSION

In conclusion, the comprehensive analysis of participants undergoing intrinsic (Group-A) and extrinsic (Group-B) exercises, particularly when stratified by age, reveals noteworthy findings. Both intrinsic and extrinsic interventions resulted in statistically significant improvements in foot function and pain levels, with Group-A consistently demonstrating a more pronounced effect across various parameters. When examining age-specific data, the distribution of participants varies, with Group-B having a higher representation in the 30-39 age group, while Group-A displays a more balanced distribution across the 30-39, 40-49, and 50-59 age groups. Notably, Group-A consistently outperforms Group-B in improving foot function and reducing pain, especially among participants above 40 years. These results underscore the potential efficacy of intrinsic exercises, particularly for individuals above 40 years old, in enhancing foot function and alleviating pain. However, the diverse age distribution emphasizes the need for careful consideration of age-related factors in interpreting and applying these intervention outcomes. Further research and exploration of age-specific responses to intrinsic and extrinsic exercises would contribute to a more nuanced understanding of their effectiveness in improving foot health.

Limitations

- Despite the insightful findings, it is important to acknowledge several limitations in this study. Firstly, the relatively small sample size within each age group may limit the generalizability of the results to broader populations.
- The unequal distribution of participants across age groups could introduce potential bias, especially in the 50-59 age range where Group-B lacks representation. Additionally, the study's duration and follow-up period are crucial factors to consider, as they may

impact the long-term sustainability of the observed improvements. The lack of a control group or alternative intervention group further limits the ability to attribute the observed changes specifically to intrinsic or extrinsic exercises.

ABSTRACT

Background: Given that physiotherapists receive education on injury prevention and body mechanics as part of their entry-level training, it might be expected that their rates of work-related musculoskeletal disorders (WRMSDs) would be lower compared to other professionals who perform patient handling tasks, such as nurses and massage therapists. Previous research has shown that psychosocial working conditions significantly affect mental distress and overall well-being.[10] Based on the literature, occupational stress has been identified as having a detrimental impact on the development of work-related musculoskeletal disorders (WRMSDs), with these cases posing substantial risks to both physical and mental health. Therefore, this study was undertaken to investigate the prevalence of WRMSDs and their correlation with mental health. **Methodology:** Subjects were qualified physiotherapists those who were based on the inclusion & exclusion criteria and participants who willingly wants to participate. 2 Questionnaire was used in this study for the outcome measures were: (1) Nordic musculoskeletal questionnaire to assess the WRMSD, (2) General health questionnaire (GHQ-12) for the assessment of the mental health. The form was administered through Email or WhatsApp to physiotherapists across the city. **Results:** There is 67% prevalence of musculoskeletal disorders among physiotherapists and there is perfect negative correlation with WRMSD with their mental health. **Conclusion:** WRMSDs are exacerbated by patient handling and demanding work conditions, not only affect physical health but also impact therapists' mental well-being. Despite the significant prevalence, many therapists do not seek timely treatment or take necessary breaks, potentially exacerbating their conditions. Addressing ergonomic practices, reducing repetitive tasks, and enhancing support systems are crucial steps in mitigating WRMSDs and promoting overall occupational health in the physiotherapy profession.

KEYWORDS

Musculoskeletal disorders, Physiotherapists, Mental Health, Nordic Musculoskeletal Questionnaire, Working Posture

INTRODUCTION

Background

According to the World Health Organization, work-related musculoskeletal disorders (WRMSDs) are defined as injuries encompassing a broad spectrum of inflammatory or degenerative diseases and disorders that lead to pain or functional impairment.[1] These disorders affect the muscles, tendons, ligaments, joints, peripheral nerves, and supporting blood vessels.[2] They include clinical conditions like tendon inflammations (such as tenosynovitis, epicondylitis, bursitis), nerve compression disorders (like carpal tunnel syndrome, sciatica), and osteoarthrosis. Additionally, they cover less well-defined conditions such as myalgia, low back pain, and other regional pain syndromes that cannot be attributed to known pathology.[3]

Physiotherapists have already taken advantage of opportunities to take on new responsibilities, including more advanced and initial practitioner roles. While they are well-positioned to tackle future healthcare challenges, there is a need for unified support within the profession to embrace significant changes in practice, including a reassessment of their role. Healthcare workers who have direct contact with patients experience the highest rates of work-related diseases, attributed to the demands of their profession and the physical positions they must maintain throughout the day.[4]

The main risk factors associated with WRMSDs include repetitive tasks, uncomfortable postures, and high levels of force. Physiotherapists frequently undertake tasks like transferring dependent patients, assisting with mat activities, and lifting heavy equipment, which increase their susceptibility to both acute and chronic work-related musculoskeletal disorders (WRMSDs).[5] A considerable number of physiotherapists suffer from work-related musculoskeletal disorders, with upper back pain, lower back pain, and hip pain being the most common issues they face.[6]

According to the results of a longitudinal study investigating the effects of musculoskeletal pain on work performance, regular musculoskeletal discomfort was associated with decreased performance. Work-related factors contributing to this include job dissatisfaction, job strain (involving psychologically demanding tasks with time pressure and low job control), time constraints, high mental pressure, relationships with coworkers, support at work, and overall stress levels [7,8].

A Literature has highlighted that high-level workplace stress can negatively impact both the body and mind, leading to reduced productivity, absenteeism, job changes, and exhaustion. Stress arising from pain or discomfort can also affect an individual's mental well-being and quality of life. [9] According to Karasek's model, which has been prominent in research on WRMSDs, four key work-related psychosocial factors high psychological job demands, low decision-making authority, inadequate social support, and job insecurity—contribute to psychological strain. This strain increases the likelihood of stress-related health issues.[12]

Methodology

Study Place

Government and private hospitals and clinics of Gandhinagar and Ahmedabad

Study Duration

1 Year

Study Design

A Cross sectional Study

Inclusion Criteria

1. Willing to participate
2. Clinical working Physiotherapist
3. Age group (25-55 years)
4. Both male and female
5. Minimum 5-6 hours of working
6. Physiotherapist with minimum 6 months - 1 year of clinical work experience

Exclusion Criteria

1. Physiotherapists who are in the administrative duty
2. Academics or performing non-clinical work

3. Female physiotherapists who are pregnant
4. Recent trauma or surgery
5. Physiotherapists who have full time working assistants

Materials required

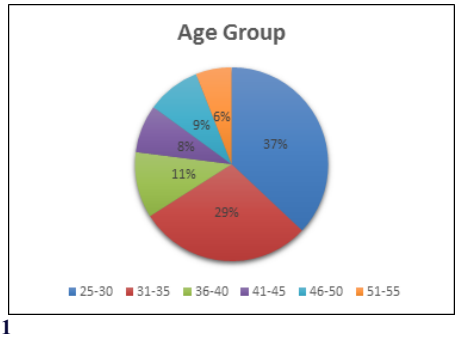
1. Mobile Phone
2. Consent form
3. Assessment form

METHOD

- Subjects were qualified physiotherapists those who meet inclusion and exclusion criteria and who are willing to participate.
- The consent was taken from all the subjects and detailed explanation of the study was also given to the subjects.
- 2 questionnaire was used in the study for the outcome measures were:
- Nordic Musculoskeletal Questionnaire (NMQ) to assess the WRMSD
- General Health Questionnaire (GHQ-12) for the assessment of the mental health
- The 1ST questionnaire consists of 2 parts. In the first part each subject were required to fill the assessment form consisting of question regarding their basic demographic details, professional details such as job/position, experience, weekly working hours and health information and the second part will consist of questions to measure the existence of musculoskeletal pain using modified Nordic musculoskeletal questionnaire.
- The 2nd questionnaire was GH-12 to assess the Mental Health. The General Health Questionnaire (GHQ-12) comprises 12 items, each evaluating the severity of mental issues over recent weeks using a 4-point scale (ranging from 0 to 3). Scores from these items are totaled to produce a score ranging from 0 to 36, where higher scores indicate more severe conditions.
- The form was administered through email or WhatsApp to physiotherapist across the city.
- A total of 410 physiotherapists were invited across Gandhinagar and Ahmedabad, among whom 276 responded. These data were analyzed based on eligibility criteria, and a total of 156 physiotherapists participated in the study.

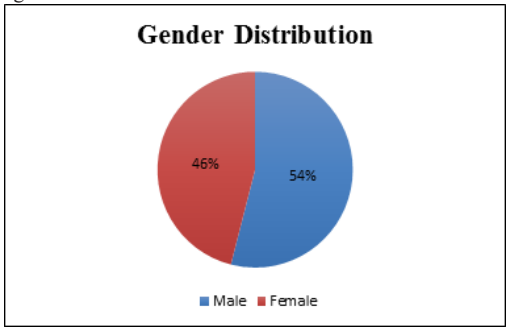
RESULTS

The analysis was done using excel.Total 156 physiotherapists are taken for the study



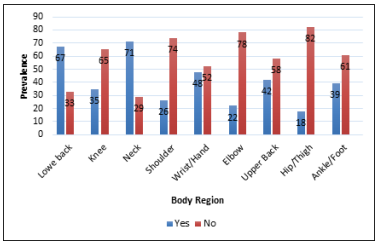
Graph 1

Graph 1 shows the age group of subjects were between 25-55 years and among them 37% were between 25-30 years, 29% were between 31-35 years, 11% were between 36-40 years, 8% were between 41-45 years, 9% were between 46-50 years and 6% were between 51-55 years. Among them 54% were female and 46% were male



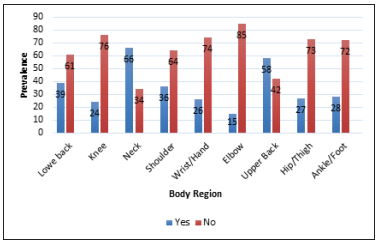
Graph 2

Graph 2 shows the gender distribution of males and females, among them 54% were male and 46% were female.



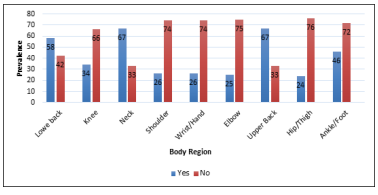
Graph 3

Graph 3 shows the prevalence in 67% suffered from lower back pain, 35% suffered from knee pain, 71% suffered from neck pain, 26% suffered from shoulder pain, 48% suffered from wrist/hand pain, 22% suffered from elbow pain, 42% suffered from upper back pain, 18% suffered from hip/thigh pain and 39% suffered from ankle/foot pain region among Physiotherapists in the last 12 months



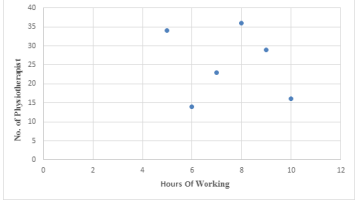
Graph 4

Graph 4 shows the prevalence in 39% suffered from knee pain, 24% suffered from lower back pain, 66% suffered from neck pain, 26% suffered from shoulder pain, 26% suffered from wrist/hand pain, 15% suffered from elbow pain, 58% suffered from upper back pain, 27% suffered from hip/thigh pain and 28% suffered from ankle/foot pain region among physiotherapists which prevented them last 12 months.



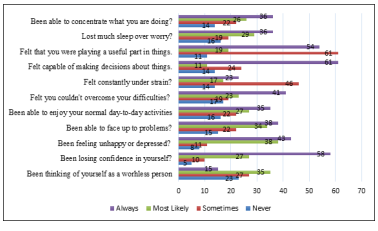
Graph 5

Graph 5 shows the prevalence in 58% are suffered from lower back pain, 34% suffered from knee pain, 67% suffered from neck pain, 26% suffered from shoulder pain, 26% suffered from wrist/hand pain, 25% suffered from elbow pain, 67% suffered from upper back pain, 24% suffered from hip/thigh pain and 46% suffered from ankle/ foot pain region among last 7 days.



Graph 6

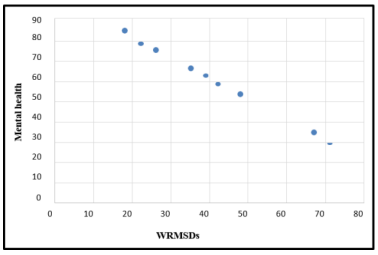
Graph 6 shows that 34 physiotherapist works for 5 hours, 14 works for 6 hours, 23 works for 7 hours, 36 works for 8 hours, 29 works for 9 hours and 16 physiotherapist works for 10 hours per week.



Graph 7

Graph 7 shows the responses of the question asked to the physiotherapist to assess the mental health related to the occupation and workplace with the help of General Health Questionnaire-12 (GH-12)

Graph 8



Graph 8 shows perfect negative correlation of Work-related musculoskeletal disorders and affection of mental health.

DISCUSSION

This study was focused on physiotherapists to investigate the prevalence of Work-related Musculoskeletal Disorders (WRMSDs) and their connection to mental health. It found that many physiotherapists, dealing with patient overload and poor posture, frequently suffer from these disorders, which can also affect their mental well-being. Out of 156 respondents, 102 physiotherapists reported experiencing work-related musculoskeletal issues, resulting in a prevalence rate of 67%. All participants completed standard Nordic Questionnaires and were interviewed about their work hours. Interestingly, despite experiencing WRMSDs, many therapists did not seek treatment, take time off work, or seek evaluation. Most therapists worked 7 hours or more daily, with some making home visits nearby. Female therapists reported more musculoskeletal problems than males, possibly due to their height and leverage issues during manual therapy. The most affected areas were the neck, lower back, and upper back, attributed to handling numerous patients, lifting dependent individuals, and working despite injuries.

The study also examined how these musculoskeletal disorders correlate with mental health, revealing a significant negative impact likely linked to their professional demands. Some therapists had developed coping strategies to manage these challenges. Psychosocial factors were also explored, revealing dissatisfaction with their profession, lack of team cooperation, poor interaction with physicians, and inadequate support from supervisors, although these associations were not statistically strong. Nonetheless, the study confirmed a 67% prevalence of musculoskeletal disorders among physiotherapists. It underscores the importance for physiotherapists to follow ergonomic guidelines, reduce repetitive tasks, or consider alternative treatments to alleviate the effects of WRMSDs.

CONCLUSION

WRMSDs are exacerbated by patient handling and demanding work conditions, not only affect physical health but also impact therapists' mental well-being. Despite the significant prevalence, many therapists do not seek timely treatment or take necessary breaks, potentially exacerbating their conditions. Addressing ergonomic practices, reducing repetitive tasks, and enhancing support systems are crucial steps in mitigating WRMSDs and promoting overall occupational health in the physiotherapy profession.

Limitations

Despite the insightful findings, it is important to acknowledge several limitations in this study Firstly, the relatively small sample size. Other factors not for affection of mental health were not taken into consideration.

A critical review on *Karanja* (*Pongamia pinnata*) & its medicinal properties

Dr. Avinash Bholane[1], Dr. Vidyavati V Hiremath[2]

[1]M.D. Ayu, Aarihant Ayurvedic Medical College, Gandhinagar, Gujarat, [2]Associate Professor, FIMS, SGT University, Gurugram, Haryana, INDIA.

ABSTRACT

Karanja (*Pongamia pinnata* Linn.) an ancient plant described in Veda, Samhita, and almost in all Nighantu. Nature has been a good source of medicinal plants since immemorial time and an impressive number of modern drugs have been isolated from plant sources, many based on their use in traditional medicine. *Karanja* has been recognized in Ayurveda - a traditional system of medicine for the treatment of various diseases of human beings. Different parts of this plant are traditionally used for the treatment of various ailments including *Kushta, Arsha, Prameha, Yonidosha,* etc. Despite the overwhelming influences and our dependence on modern medicines and tremendous advances in synthetic drugs, an outsized segment of the planet population still likes drugs of plant origin. Of the 2,50,000 higher plant species on earth, quite 80,000 are medicinal. However, only 7000-7500 species are used for his or her medicinal values by traditional communities. Therefore, the present review study reveals the overall information of *Pongamia pinnata* with various scientifically documented pharmacologically activities, traditional uses along its non-therapeutic importance.

Key words: *Karanja, Pongamia pinnata, Ayurveda.*

INTRODUCTION

Karanja [*Pongamia pinnata*(Linn.) Merr.] is one of the popular and extensively used herbs in Ayurvedic medicine. It belongs to family Fabaceae. The references of *Karanja* are found in Rugveda and Atharvaveda. In Rigveda the term *Karanja* is used as the name of *Rakshasa* (Demon) and in Atharvaveda *Karanja* is used as the Mantra. In Kalpasutra *Karanja* is used as a name of plant.[1]

In Charak Samhita it is quoted for *Dhantadhavan*.[2]

Karanja is mentioned among the *Kandughna Varga* by Charaka. Sushruta highlighted the utility of *Karanja Taila* in *Krimi, Kushta, Prameha* and *Siroroga* and quoted it as *Kapha-Vathara, Shothahara, Kandughna* (anti-itch) and *Bhedana*.[3]

It contains Karanjin, pongapin, Karanja chromen. It shows antibacterial, hypoglycaemic activity. The essential oil from *P. pinnata* showed mild antifungal activity. Another importance of *Karanja* is because of its oil-containing seeds. The *Pongamia pinnata* seeds contain about 40% oil, which can be converted to biodiesel by transesterification method (Meher *et al.* 2006).

In the present article information on various aspects of *Pongamia pinnata* and its medicinal properties are reviewed.

Vernacular Names

Karanja [*Pongamia pinnata* (Linn.)] is commonly known as Indian beech in English and Dithouriin Hindi, *Karanja* in Sanskrit, Marathi and in Gujrathi, Dahar

ISSN: 2456-3110 REVIEW ARTICLE Mar-Apr 2020

Karanja in Bengal, Pongum in Tamil, Punagu in Telagu.[4]

The plant *Pongamia pinnata* (Linn) is known as *Karanja* because when it grows on the banks of stream imparts bluish color to the water, with flowers scattered there in (*Udakirya*). Which are shaped like a nail (Karaj) or parched paddy (*Lajapushpak*) in bunches (*Gucchapushpak*) and blooming in the night (*Naktamal*). The leaves are glossy (*Snighdhapatra*), the leaves look like they are oozing *Ghruta* (*Ghrutparnak*). The seeds yield oil like ghee (*Ghrutpurna*). It is an effective drug for filaria (*Sleepada*).[5]

Botanical Description

It is a medium-sized glabrous almost evergreen tree, growing up to 18m height and 1.5m in girth.

Leaves: 8-10inch long, pale green, imparipinnate; leaflets 5-7, oblong or ovate, obtuse or shortly acuminate, 2-4-inch-long, sub coriaceous, midrib and lateral nerves rather prominent beneath.

Flowers: in simple peduncle axillary racemes nearly as long as the leaves; nodes tumid bearing 2-4 pedicels; rachis and pedicels sparsely puberulous; pedicels with 2 bracteoles at the base and with 2 others, towards the apex. Calyx widely campanulate, mouth truncate. Corella ½ inch or less, white tinged with violet or pink; standard orbicular, silky on the back, subcordate and2 auriculate at the ace. The ovary is finely pubescent.

Fruit: Pod 1 ½ -2inch long, with a short decurved point, turgid, woody, glabrous, brownish-green, 1-rarely 2-seeded.

Seeds: 1-2, elliptic or reniform, wrinkled, white, marbled with brownish lines.

Bark: Thin grey to greyish brown and yellow on the inside.[20]

ISSN: 2456-3110 REVIEW ARTICLE Mar-Apr 2020

Distribution

This tree is found all over India, up to an altitude of 1200m. Commonly found in the coasts of South India and also found in river banks, Central eastern Himalayas and its foothills (Shivalik and Others).[21]

Chemical Constituents

The plant *P. pinata* has been subjected to chemical investigations extensively and several chemical constituents belonging to the different groups, viz. alkaloids, tannins, glycosides, steroids, saponins, flavonoids have been reported. The plant mainly contains alkaloids, protein, fatty oil, tannins, and a mixture of fatty acids.

Folk Medicine

According to Hartwell (1967–1971), the fruits and sprouts are used in folk remedies for abdominal tumors in India, the seeds for keloid tumors in Sri Lanka, and a powder derived from the plant for tumors in Vietnam.

In India, seeds were used for skin ailments. Today the oil is used as a liniment for rheumatism. Leaves are active against *Micrococcus*; their juice is used for colds, coughs, diarrhea, dyspepsia, flatulence, gonorrhea, and leprosy. Roots are used for cleaning gums, teeth, and ulcers. The bark is used internally for bleeding piles. Juices from the plant, as well as the oil, are antiseptic. It is said to be an excellent remedy for the itch, herpes, and pityriasis Versicolor.

Powdered seeds are valued as a febrifuge, tonic, and bronchitis and whooping cough. Flowers are used for diabetes. Bark has been used for beriberi. Juice of the

ISSN: 2456-3110 REVIEW ARTICLE Mar-Apr 2020

root is used for cleansing foul ulcers and closing fistulous sores. Young shoots have been recommended for rheumatism.[38]

Pharmacological Activity

- Anti-plasmodial activity - *Pongamia pinnata* shows anti-plasmodial activity against Plasmodium falciparum (Simonse et al. 2001).[39]
- Anti-inflammatory activity - It shows anti-inflammatory activity against different phases (acute, sub-acute and chronic) of inflammation was reported by the 70% ethanolic extract of *Pongamia pinnata* leaf (Srinivasan et al. 2001).[40]
- Anti-Microbial Effect - The anti-microbial effect of crude leaf extract of P. pinnata evaluates its effect on the production and action of enterotoxins. Its extraction has o anti-bacterial, anti-giardia, and anti-rotaviral activities but reduces the production of cholera toxin and bacterial invasion to epithelial cells. This indicates that the extraction of *Pongamia pinnata* has selective anti-diarrhoeal action with efficacy against cholera (Brijesh et al. 2006).[41]
- Anti-oxidant activity - P. pinnata leaf extracts show circulatory lipid peroxidation and antioxidant activity. It has been evaluated in ammonium chloride-induced hyper ammonium rats. That enhanced lipid peroxidation in the circulation of ammonium chloride-treated rats, resulting ina significant decrease in the levels of vitamin A, C, E which further reduces catalase glutathione, glutathione peroxides and superoxide dismutase (Essa and Subrahmanian.2006).[42]
- The methanolic extract of P. pinnata roots showed significant protection against aspirin and tends to decrease acetic acid-induced ulcer after 10 days of treatment. Having augmentation of mucosaldefensive factors like – mucin secretion, the life span of mucosal cells, mucosal cell glycoprotein's, cell proliferation and prevention oflipid peroxidation, the extract also shows ulcers protective effect (Prabha et al. 2003).[43]
- The oral administration of ethanolic extract of *Pongamia pinnata* flower shows significant anti-hyperglycemic and anti-lipid peroxidative effect and also enhance the antioxidant defense system in alloxan-induced diabetic rats. Hence suggestive that the treatment of P. pinnata extract could be used as a better and safe alternative anti-hyperglycemic drug for diabetic patients (Punitha and Manoharan, 2006).[44]

Ayurvedic Properties and Pharmacological Effect

Almost all the Aacharya have opined the properties of *Karanja* is *Tikta* (bitter), *Katu* (pungent) *Kashaya* (astringent) in *Rasa* (taste), *Laghu* (light) and *Tikshna* (sharpness) in *Guna* (properties), *Ushna* (hot) in *Virya* (potency) and *Katu* (pungent) in *Vipaka* (metabolism).

Due to these properties, it alleviates *Vata* & *Kapha Dosha.*

Seed

Steam Bark

Twigs (as toothbrush)

Seed oil

Dose[47]

Fresh juice 10-20ml,

Seed Powder 1-3gm,

Bark powder 3.5gm.

Therapeutic Uses

- In *Granthivisrpa* paste of *Karanja* bark may be applied locally.[48]
- *Karanja* leaves are fried in *Ghruta* and made it into powder. This powder is administered along with *Saktu* for *Anuloman*.[49]
- *Karanja* fruit mixed with *Saindhav, Danti, Marich, Pippali* and powdered it. This powder used in *Kushta* for *Nasya*.[50]
- *Karanja Patra* can be used for *Pradeha* in *Kushta*.[50]
- *Kasis* and tender leaves of *Karanja* pounded with the juice of *Kapitha* is useful in *Romasanjanan*.[51]
- Seed powder of *Karanja* should be given with sugar and honey in *Raktapitta*.[52]
- *Yavagu* prepared along with *Kwath* of leaves of *Karanja* is administered for all types of *Chardi*.[53]
- *Karanja* along with *Haritaki*, *Vidang, Sidharthak, Bakuchi, Haridra* is used for *Lepan* in *Kushta*.[54]
- *Karanja Taila* should be applied in *Vrana* due to *Kushta*.[55]
- For *Vrana Prakshalan Karanja* fresh juice can be used.[56]
- *Karanja* along with *Gomutra* should be used for *Lepana* in *Urusthamba*.[57]
- Tender leaves of *Karanja* fried in the mixture of oil and *Ghruta* and added with parched grain flour should be given. It acts as carminative and laxative.[58]
- The alkali of *Karanja* decanted with sour gruel etc. and added with *Bida* and *Pippali* powder should be used for splenomegaly.[59]
- In Pterygium after removing the bandage on the third day, it should be sprinkled with milk processed with *Karanja* Seed.[60]
- In Scorpion sting, the flowers of *Karanja*, *Arjun*, *Shleshmatak, Katabhi, Kutaj* and *Shirish* mixed with cured are applied as a paste on the spot.[61]

Non-Therapeutic Uses[62]

- The Pongamia tree is cultivated for two purposes, as an ornamental in gardens and along avenues and roadsides for its fragrant flowers and as a host plant for lac insects.
- Well decomposed flowers and leaf letters are used by gardeners as compost for plants requiring rich nutrients. The bark is used for making strings and ropes.
- The leaves are said to be a valuable lactagogue fodder, especially in arid regions. It is sometimes intercropped with pasture, the pasture grasses said to growwell in its shade.
- Dried pongam leaves are used in stored grains o repel insects. Leaves often ploughed green manure, thoughts to reduce nematode infestations.
- The wood is yellowish-white, coarse, hard and beautifully grained, but is not durable. The use of wood islimited to cabinet making, cartwheels, posts, and fuel.
- The seeds contain pongam oil, bitter, red-brown, thick, non-edible oil, which is used for tanning leather, soap making.
- Both the oil and residues are toxic. Still the press cake is described as a useful poultry feed.
- As a Source of Biodiesel - Biodiesel is expanding at a very rapid rate because of increasing demand, necessary policy support, and technological availability. India consumes approximately 40 million tons of biodiesel and ranked fifth in the

ISSN: 2456-3110 **REVIEW ARTICLE** Mar-Apr 2020

world after the US, China, Russia and Japan in terms of fossil fuel consumption. Recently, the Government of India launched "National Mission on Bio-diesel" with a review to find a cheap and renewable liquid fuel based on vegetable oils. Biodiesel fuel can be defined as medium length (C16 ± C18) chains of fatty acids and is comprised mainly of monoalkyl fatty acid esters. It has the benefits of being non-toxic, biodegradable, and essentially free of sulfur and carcinogenic ring components (Yamane *et al.* 2001).

- The *Pongamia pinnata* is known for its multipurpose benefits and as a potential source of biodiesel (Naik et al. 2008).

Toxicity[63]

LD_{50} for Karanjin was found to be 14.32mg/kg and of pongamal 17.14mg/kg body weight. The pure oil did not show lethal effect even at 20ml/kg body weight. *Karanja* Oil is found to be most toxic and it is prepared to have an adverse effect on the body of mice. Karanjin and de-Meo-Karanjin are also reported to be toxic compounds.

CONCLUSION

Pongamia pinnata (*Karanja*) is one of the most important medicinal plants used in medicines of Ayurveda because of having several pharmacological as well as therapeutic properties and Industrial uses. Traditionally, this plant is used to treat a huge variety of health problems. The present review indicates the importance of Karanja as one of the important medicinal plants described for its pharmacological actions and indications in the Ayurvedic lexicons. The various researches have proved many of its activities mentioned in Ayurvedic classics and demonstrate its effective use in various diseases. The plant is widely studied for the subject of biodiesel. Although the results from this review are quite promising for the use of *Karanja* as a multi-purpose medicinal agent, several limitations currently exist in the current literature. While *Karanja* has been used successfully in Ayurvedic medicine for centuries, more clinical trials should be conducted to support its therapeutic use.

Abstract
Ayurveda describes numerous drugs in classics. *Bharangi* is very important drug describe in various classics of Ayurveda. Which is widely used in *Shwasa*, *Kasa*, *Granthi*, *Shotha* etc diseases. Due to increased demand of *Bharangi*, it is adulterated by different plant. Thus, substitution of this plant is necessary. The drugs which have similar morphology and property are included in same family. *Acharya Bhavprakash* said that if two drugs having similar *Rasapanchaka* then one can takes as alternative of original source. Here, both drugs are used broadly in clinical practise. *Clerodendrum phlomidis* (Linn) F. used for *Meda*, *Shopha*, *Shwayathu*, *Shwas*, *Kasa*, *Pratishyay* etc. Root of both drugs have been used. Consequently, *Clerodendrum serratum* L. and *Clerodendrum phlomidis* L. both drugs belong to the same family i.e. Lamiaceae and similar *Rasadipanchaka*. Therefore, it may be *Clerodendrum phlomidis* L. used as a substitute of *Bharangi*. The study includes comparative investigations macro and microscopic characters, preliminary phytochemical analysis, physicochemical parameters and HPTLC fingerprinting of both sample drugs. Based on present phytopharmacognostical study *Clerodendrum serratum* (Linn) kutz. may be used in the scarcity of *Clerodendrum phlomidis* (Linn) F.

Keywords: lamiaceae, clerodendrum serratum (linn) kutz, clerodendrum phlomidis (linn) f, pharmacognosy, prilimary phytochemical investigation, HPTLC

Introduction

Bharangi and *Tarkari* both drugs are mentioned in Ayurvedic classics. Botanical source of *Bharangi* is *Clerodendrum serratum* (Linn) kutz. and *Tarkari; Clerodendrum phlomidis* (Linn) F. according to standard references of API and database on medicinal plants belonging to the same family Lamiaceae and genus [1]. The blue flowered shrub *Bharangi* is grown in lower Himalaya from Kumauni eastwards and west Bengal, Bihar up to an altitude of 1200m. It is Reported to be rare and endangered in Gujrat.[2] Traditionally root, leaves and seed used for bronchitis, Asthma, wound, Blood purifier etc.[3] A large shrub or small tree of *Clerodendrum phlomidis* L. is distributed throughout the India, in sub-Himalaya tracts of Bihar, Gujrat, Konkan, Kolkata etc. *Bharangi* is broadly used for *Shwasa*, *Kasa*, *Jwara*, *Sotha*, *Vataja Granthi*, *Kaphaja Granthi*, *Raktagulma* etc [4, 5, 6]. While *Tarkari* is useful *Shwasa*, *Kasa*, *Jwara*, *Shwayathu*, *Medohara* etc [7]. Both plants used individually as well as in formulations. *Bharangi* root used for *Shwasa*, *Kasa* etc. *Tarkari patra* used as vegetable, external *lepa* etc [8]. Root *lepa* also done in inflammatory condition [9]. *Bharangi* is highly valued and important ingredient of many popular Ayurvedic formulations like *Bharangyadi leha*, *Kankasava*, *Dahmula-arista*, *Dashmula kwatha*, etc. *Tarkari* as ingredient of *Narayana Taila*, *Varunadi Kwatha*, *Vyaghriadi Kashaya* etc. Due to increased demand of *Bharangi*, there is concerning reduction in availability, it is adulterated by other spurious, inferior, defective, spoiled, useless other parts of same or different plant [10]. *Tarkari* and *Bharangi* both are belonging from same family and genus and classically also having similar *Rasadipanchaka*. Accordingly, *Tarkari* is may be used in place of *Bharangi*. The present study includes macro and microscopic characters, preliminary phytochemical analysis, physicochemical parameters and HPTLC fingerprinting of both plants root.

Materials and Methods

Collection and authentication of plant materials

The root of *C. serratum* were collected from Lumbini Bhesaj Udyan, Sri Nrusinghnath Ayurveda College & Research Institute, Paikmal, Odisha and *C. plomidis* roots were collected from hathijana Ahmedabad, Gujarat in January 2019. Both sample were identified by local vaidya and taxonomist and confirmed by studying the morphological characters comparing them with various characters described in different floras and books [11]. Both

specimens were authenticated by pharmacognosist. Herbarium of the samples has been deposited to institute's pharmacognosy laboratory and provided with authentication number (specimen no. phm/6291/18-19 & phm/6292/18-19)

Pharmacognostical studies

The macroscopy and microscopy of both the roots were studied as per standard procedures. Thin free hand transverse section of both the roots were observed under the microscope to evaluate microscopic characters. Photographs of the section were taken with the help of Quasmo binocular compound microscope in pharmacognosy laboratory. Powders (80#) of leaf was studied for organoleptic and microscopic characters after proper mounting and staining with different reagents [12].

Physico-chemical analysis

Organoleptic examination, macro, microscopy, and physicochemical studies, viz., Ash value, water-soluble ash, water and alcohol soluble extractive value, pH value, loss on drying at 110 C as per standardized methods.[13]

Phytochemical analysis

Qualitative analysis was performed to detect primary and secondary metabolites in water and alcohol extracts of leaf. Tests for carbohydrates, protein, amino acid, steroids, glycosides, saponins, alkaloids, tannins and flavonoids, [14, 15]

HPTLC study

Methanolic root extract of *C. serratum* and *C. phlomidis* were exposed to HPTLC study. The solvent system used for the study is toluene: Formic acid (7:3:0.3) Chromatographic conditions: Application mode was Camag Linomat V, Development Chamber used was of Camag Twin trough Chamber. Precoated Silica Gel GF254 Plates were used. Chamber saturation was done for 30 min and development time was 30 min. The plate was scanned in Camag Scanner III with Deuterium lamp, Tungstan Lamp as detectors and Wincats software was used for data analysis.

Results and Discussion

Morphology

Bharangi (*Clerodendrum serratum* L.) and *Tarkari* (*Clerodendrum phlomidis* L.) both the species had *Katu, Tikta Rasa* according to most of the nighantus. Colour whitish brown in *Clerodendrum serratum* L. and creamish yellow in *Clerodendrum phlomidis* L. and both perceived aromatic odour. Based on the morphology and microscopical study done by pharmacognostical methods

Microscopic characters

Transverse section of *Clerodendrum serratum* (Linn) kutz. (Fig. 1c to 1h)

The diagrammatic section of the root shows, outermost cork followed with cortex, phloem and central xylem. Details section shows cork consisting of 10-12 layers of thin walled tangentially arranged cells having wavy radial conjoining cell walls at places. Outermost layers observed with dark brown color, while the inner layers with alteration of lignified and simple cork tissues. Cortex appearances broad cortical zone made up of roundish to oval thick walled parenchymas. Stone cells and sclereids found scattered either isolated or in groups. The phloem composed of sieve tubes with compound sieve plates, companion cells, phloem rays and parenchyma. Xylem occupies almost ample central area and consists of vessels, tracheids, fibers, xylem rays and xylem parenchyma. Medullary rays bi to multi seriated. Prismatic and acicular crystals of calcium oxalate and simple and compound starch grains with hilum found throughout the section.

Transverse section of *Clerodendrum phlomidis* (Linn) F. (Fig. 2c to 2h) The diagrammatic section of the root shows, outermost cork followed with cortex, phloem and central xylem. Details section shows Cork consisting of 15-20 layers of thin walled tangentially arranged cells having wavy radial conjoining cell walls at places. Cortex demonstrations broad cortical zone made up of roundish to oval thick walled parenchyma embedded with prominent layer of Stone cells and sclereids especially three-sided thickened stone cells and sclereids found scattered either isolated or in groups almost filled with prismatic crystals of calcium oxalate. The phloem composed of sieve tubes with compound sieve plates, companion cells, phloem rays and parenchyma encircling central xylem. Xylem occupies central area and consists of vessels, tracheids, fibers, xylem rays and xylem parenchyma. Medullary rays mostly biseriated. Prismatic and acicular crystals of calcium oxalate and simple and compound starch grains with hilum found throughout the section.

Organoleptic characters and microscopic particulars:

***Clerodendrum serratum* L. Root:** powder was whitish brown in colour, bitter taste, strong aromatic odour and fibrous in touch. (Fig. 3a)

The presence of simple and compound starch grain, prismatic & acicular crystal, bordered pitted vessel, simple & compound starch grain with hilum, stone cell & sclereid and group of fibers observed during the powder microscopy of *Clerodendrum serratum* L. (Fig. 3b to 3j)

Clerodendrum phlomidis L. Root: powder was Creamish yellow in colour, astringent taste, Aromatic odour and fibrous in touch. (Fig. 4a)

Powder microscopy of *Clerodendrum phlomidis* L. found Starch grains, Prismatic crystals, Pitted vessel, Bordered Pitted vessel, fibers, Stone cells and sclereid, brownish coloured cork cell in surface view was observed. (Fig. 4b to 4j)

The study reveals that both the species shows almost similar characters. However, it can be differentiated by some characters. Macroscopically, the colour, size, and shape of

the roots are the only the differentiating characters of the both species. Differentiating key characters of both species observed as, in *Clerodendrum serratum* L. bi-multi seriated medullary rays, bordered pitted vessel and simple & compound starch grains with hilum while mostly bi-seriated medullary rays, simple & compound starch grains pitted vessel in *Clerodendrum phlomidis* L. root. The peculiar character like, three-sided thickened stone cells & sclereids was observed only for *Clerodendrum phlomidis* L. root. Starch grains, Prismatic crystals, Bordered Pitted vessel, fibers, Stone cells and sclereid were observed commonly in both the species root powder.(Fig. 3&4)

Phytochemical analysis

All the physicochemical analysis except Loss on drying were comparatively within negligible limits. Loss on drying in raw sample of *Clerodendrum serratum* (Linn) Kutz. Root was found 6.25%w/w. Which is significantly more than that of *Clerodendrum phlomidis* (Linn) F. (3.97%w/w) sample. It is suggested that *Clerodendrum serratum* (Linn) Kutz. Root having more water content than other sample of *Clerodendrum phlomidis* (Linn) F. (Table 2) Preliminary phytochemical analysis revealed that the presence of metabolic like glycoside, carbohydrates, steroids, flavonoids and tannins in both the samples while alkaloids, protein, amino acids and saponins are absent. (Table 3)

HPTLC profile

The observations are tabulated in table 4. At 254nm; root of *Clerodendrum serratum* L. found 14 spots where as 8 spots in case of *Clerodendrum phlomidis* L. respectively. *Clerodendrum serratum* L. root found 7 spots and also *Clerodendrum phlomidis* L. found 7 spots at 366 nm. Similar spots of Rf values 0.09 and 0.43 were detected in both the samples (Fig5). Common R_f values like 0.09 and 0.30 at 254nm, 0.09, 0.30 and 0.43 at 366 nm while 0.09 and 0.30 were found for both the samples at both the wavelengths observed similar indicating the presence of analogous type of components in both the species.(Fig. 5) This indicates the presence of same common chemical components as per the observed spots in different wavelengths like visual, 254nm and 366nm respectively, areas and graphical curves. This similarity might be present due to same family or genus of the plant materials. (Table 4)

Table 1: Macroscopic character of *C. serratum* and *C. phlomidis* Root (fig. 1a, 1b and 2a, 2b)

Average length	2 cm to 4 cm	8 cm to 10 cm
Touch	smooth or longitudinally striated or wrinkled, older somewhat rough	root bark thin, easily peal-able, tough, rough due to exfoliation, longitudinal striated in old one
Colour	Externally pale reddish brown easily peal-able outer skin, Internally yellowish brown	light brownish ashy in colour, inner surface whitish- yellow
Odour	Aromatic	Aromatic
Taste	Bitter, Astringent	Astringent
Fracture	Short	Hard with sound, Fibrous

Table 2: Physicochemical parameters of *C. serratum* and *C. phlomidis* root powder

Sr. no	Physico -chemical Parameters	*C. serratum* L	*C. phlomidis* L
1	Loss on drying(%w/w)	6.25	3.97
2	Ash Value(%w/w)	2.10	2.62
3	Water soluble extract(%w/w)	18.68	18.28
4	Methanol soluble extract (%w/w)	16.6	15.24
5	pH	6.2	6.5

Table 3: Result of qualitative tests of methanolic extract of *C. serratum* and *C. phlomidis* root.

Sr. no	Active constituent	Test	*C. serratum* L	*C. phlomidis* L
1	Alkaloids	Dragendorff's test	-	-
2	Steroids	Salkowaski reaction	+	+
3	Amino acids	Ninhydrin test	-	-
4	Carbohydrates	Molisch's test	+	+
5	Flavonoids	Lead acetate	+	+
6	Tannins	Lead acetate	+	+
7	Glycosides	Keller Killiani test	+	+
8	Saponins	Foam test	-	-

"+": Positive, "-": Negative

Table 4: HPTLC analysis of methanolic extract of *C. serratum* and *C. phlomidis* root.

Sample	Solvent system	254 nm (Short UV)		366 nm (Long UV)	
		No. of spots	Rf values	No. of spots	Rf values
C. serratum L	Toluene: Ethyl acetate: Formic acid (7:3:0.3)	14	0.02, 0.09, 0.15, 0.22, 0.31, 0.39, 0.45, 0.54, 0.61, 0.67, 0.72, 0.84, 0.91	7	0.02, 0.09, 0.24, 0.31, 0.36, 0.43, 0.61

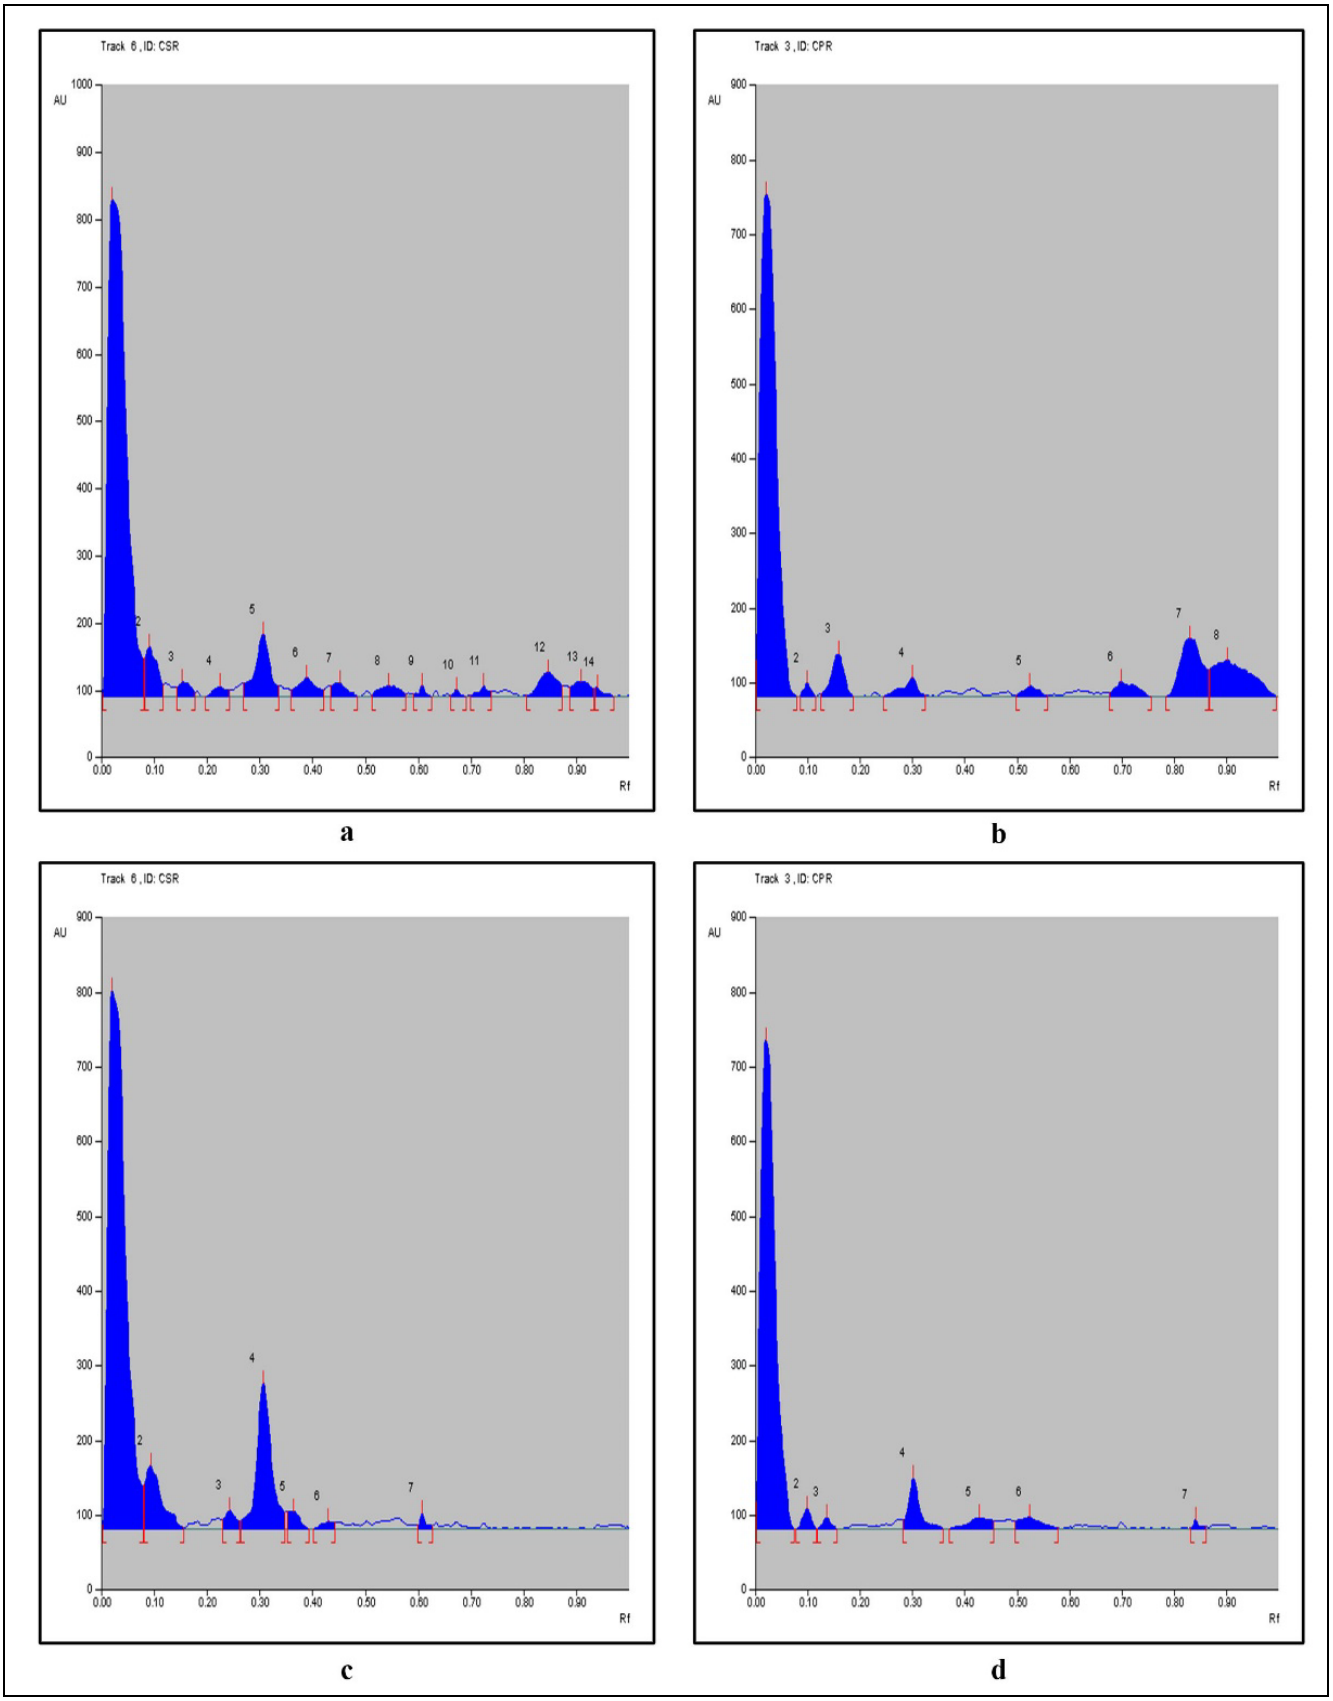

Fig 5: Densitometry chromatogram of C. serratum L. and C. phlomidis L. at 254 and 366 nm.

Conclusion

Bharangi is *Clerodendrum serratum* (Linn) Kutz. And *Tarkari; Clerodendrum phlomidis* (Linn) F. according to standard references API and database on medicinal plants belonging to the same genus and family Lamiaceae. According to conducted study of both plants, concluded that both the species shows the same *Katu, Tikta Rasa*. Both the plants have virtually similar morphological and microscopical characters as observed in pharmacognostic study. Consequently, it can be decisively concluded that *Clerodendrum phlomidis* (Linn) F. may be used in the scarcity of *Clerodendrum serratum* (Linn) Kutz. Based on

performed pharmacognostical study and physico-phytochemical study.

ABSTRACT

Background: - *Tamaka Shwasa* is a chronic inflammatory disorder of the lung airways. The current suffering population is looking hopefully towards *Ayurveda* for better life. *Ayurveda* has number of formulations to treat *Tamaka Shwasa* with route eradication and is in practice with proven efficacy. **Aims: -** To evaluate the efficacy of *Devadarvyadi Kwatha* and *Vasadi Kwatha* in the management of *Tamaka Shwasa*. **Material and Methods: -** 30 patients were registered into two groups; Group A was treated with *Devadarvyadi Kwatha*, while Group B was with *Vasadi Kwatha* at dose of 40 ml twice a day for the duration of 28 days. Follow up was done after 14 days. The results were assessed in terms of clinical recovery, symptomatic relief, and pulmonary function improvement. Effect of the treatment was assessed based on subjective and objective parameters. **Results:-** Significant improvement was observed in most of the cardinal and associated symptoms. Significant increase in peak expiratory flow rate, and increased E.S.R., decreased frequency of attacks, improved quality of life were the major observations noticed in both groups. **Conclusions: -**This study highlights the significance of traditional herbal formulations in *Tamaka Shwasa*, which can be used as an effective drug in place or along with modern drugs.

KEYWORDS: - *Tamaka Shwasa*; Bronchial Asthma; *Devadarvyadi Kwatha; Vasadi Kwatha.*

INTRODUCTION

According to WHO Asthma is one of the major non communicable diseases. It is a chronic disease of the air passage of the lungs which inflames and narrows them. Around 235 million people currently suffer from Asthma worldwide. It is common disease among children. Most Asthma related deaths occur in low and lower middle income countries.[1]

With the explosion of the knowledge in the 21st century a new concept of multi factorial causation of disease has arisen due to changing pattern of life styles, living standards, demographic factors, urbanization, over growth of industrialization and auto mobilization. Health emerges from highly complex interaction between factors intrinsic to the patient and environment. In today's environment there is so much pollution, which cannot be avoided because it mostly produced by vehicles and industries. This environment interaction is leading to many respiratory disorders among which one of the major distressing disease is Asthma which has been described in *Ayurveda* as *Shwasa.*

Devadarvyadi Kwatha[2] and *Vasadi Kwatha*[3] are herbal medicinal combinations used commonly in the treatment of various disease of *Pranavaha Srotodushti.* By looking at the individual herbal constituents and their pharmacological action as mentioned in Ayurvedic texts, it appears that these combinations should be very effective in combatting the attack of *Tamaka Shwasa.* Therefore in the current study it has been planned to evaluate clinical efficacy of *Devadarvyadi Kwatha* and *Vasadi Kwatha* in treatment of *Tamaka Shwasa.*

MATERIAL AND METHODS

- **Source of data**

30 patients were randomly selected irrespective of their age, sex, religion, occupation etc. from the OPD and IPD of Govt. Akhandanand Ayurved Hospital. The study obtained Institutional Ethics Committee clearance (No. college 94 dated 01/08/2018) and registered at Clinical Trial Registry of India (CTRI/2019/06/019643). A written informed consent from each patient was taken before enrolling in the clinical trial.

- **Inclusion criteria**

Patients with minimum symptoms like *Kasa, Kanthodhwansa, Kapha Nishthivanam, Pinasa, Shayane Shwasa Pidita, Asino Labhate Saukhyam, Ushna Abhinandaitam* with aged between 20 to 65 years and less than 10 years of chronicity of *Tamaka Shwasa* were selected.

- **Exclusion criteria**

The patients having asthma due to cardiac pathology and associated with complications like Tuberculosis, corpulmonale, Emphysema, malignancy and tumour, Hypertension, Diabetes Mellitus, and any other diseases which lead to fatal conditions had been excluded and also pregnant and lactating mothers were excluded.

- **Withdrawal criteria**

Patients with severity of more than 2 attacks per day had been withdrawal, Constant fatigue, Increased mucus production, Pneumonia, Severe chest pain, Underperformance or absence from work, Leading to other problem such as high blood pressure.

If patient would suitable as per inclusion criteria and already taking modern medicine then 2 weeks of wash out period had been given.

- **Investigation**

Blood: Hb%, differential count (Neutrophil, Eosinophils), erythrocyte sedimentation rate and pulmonary function test were carried out.

- **Diet**

Patients were advised to avoid causes and aggravating factors such as curd, cold drinks, fish and meat, tobacco chewing and smoking, alcohol, excessive physical work, day sleep, and exposure to dust, smoke, pets, and pollens. Patients were advised to use lukewarm water after meal and at bed time. They were also advised for light diet, breathing exercises such as *Pranayama*, use of mask while working, to avoid exposure to dust and smoke, etc.

- **Study design**

30 patients suffering from *Tamaka Shwasa* of either sex between the age group of 20 to 65 years were selected for the study. A special proforma was prepared with all points of history taking, physical signs and symptoms and laboratory investigations to confirm the diagnosis as mentioned in our classics as well as allied sciences. These patients were subjected to *Devadarvyadi Kwatha*[4] and *Vasadi Kwatha.*[5]

- **Grouping and Posology**

Devadarvyadi Kwatha, as described in *Yoagartnakara, Hikka-Shwasa Rogadhikara* was selected. The list of the herbs is as mentioned below:

Table 1: Drugs of *devadarvyadi kwatha.*

Sr. No.	Name of drug	Latin name	Part
1	*Devdaru*	*Cedrus Deodara Roxb.*	1 Part
2	*Vacha*	*Acorus Calamus Linn.*	1 Part
3	*Vyaghri*	*Solanum Surattence Burm F.*	1 Part
4	*Vishva*	*Zingiber Officinale Roxb. Rosb*	1 Part
5	*Katphala*	*Myrica Esculenta Buch. Ham. Ex. D. Don*	1 Part
6	*Pushkaramoola*	*Inula Racemora Hook F.*	1 Part

In other group, *Vasadi Kwatha* as mentioned in *Bhaishajya Ratnavali* in *Hikka-Shwasa Rogadhikara* (16/27) was selected. The ingredients are enlisted as below:

Table 2: Drugs of *vasadi kwatha.*

Sr. No.	Name of drug	Latin name	Part
1	*Vasa*	*Aghatoda Vasika Nees*	1 part
2	*Haridra*	*Curcuma Longa Linn.*	1 part
3	*Dhanika*	*Coriandrum Sativum Linn.*	1 part
4	*Guduchi*	*Tinospora Cordifolia Linn*	1 part
5	*Bharangi*	*Clerodendrum Serratum Linn.*	1 part
6	*Pippali*	*Piper Longum Linn.*	1 part
7	*Nagara*	*Zingiber Officinale Roxb.*	1 part
8	*Kantakari*	*Solanum Surattence Bunn F.*	1 part

A total of 30 patients were randomly grouped into A and B, in Group A (n = 15) received *Devadarvyadi Kwatha*, while Group B (n = 15) *Vasadi Kwatha* received; at dose of 40ml twice a day in the morning and evening for the duration of 28 days. Follow-up period was 14 days in both groups.

- **Criteria for Assessment**

The improvement in the patients was assessed on the basis of relief in the cardinal signs and symptoms of the disease. Improvement in the relief of *Srotodushti*, *Lakshana* of *Dosha*, *Dushya*, and *Srotasa* were taken into account. In addition, following laboratory assessment were carried out after treatment.

a) Haematological investigations after completion of treatment were reported.
b) Respiratory function tests were reported during the treatment by using Mini Peak flow meter.

All the signs and symptoms were given scores depending upon their severity before and after treatment.

- **Assessment of total effect of therapy**

The improvement in quality of life were considered in all the below mentioned categories for final assessment.

- Improved: 100% relief of signs and symptoms
- Markedly improved: Improvement between >75% and 99%
- Moderately improved: Improvement between >50% and 75%
- Mild improvement: Improvement between 25% and 50%
- Unchanged: No relief in signs and symptoms.

- **Statistical analysis**

The information gathered on the basis of observation was subjected to statistical analysis in terms of mean score (x), standard Deviation (S.D.) standard error (S.E.), Wilcoxon test, Mann Whitney Test, Unpaired 't' test, Paired t-test was carried out at the level of 0.05, 0.01, 0.001,0.0001 of P level. Insignificant P >0.05; Significant P < 0.05; Very Significant P < 0.001; Extremely Significant P < 0.0001

- **Observation**

Total 30 patients completed the course of treatment. Both groups' observation data are given as below:

Table 3: General observations.

Observation	Result (Max %)
Age (51- 65 years)	43.33%
Sex (Male)	66.66 %
Marital Status (Married)	83.33%
Religion *(Hindu*)	73.33%
Education (Higher Secondary)	33.33 %
Occupation (Service/Job)	36.66%
Socio-Economic Status (Middle Class)	73.33%
Desha (*Sadharana*)	100%
Onset (Gradual)	73.33%
Chronicity (2 - 5 Years)	66.66%
Postural Aggravation (Sleeping)	76.66%
Treatment History (Taken)	100%
Allopathy Drug History	100%
Past Illness (No)	90%
Family History (Positive)	66.66%
Nidra (*Khamdita*)	76.66%
Divaswapana	46.66%
Vyasana (Smoking)	26.66%

Agni (Mandagni)	46.66%
Sharirika Prakriti (Vata-Kapha)	46.66%
Manasika Prakriti (Raja-Tama)	40%
Vikriti (Lakshya Nimita)	73.33%
Dosha Parikshana (Kapha Dosha involvement*)*	41.94%
Srotodushti Parikshana (Pranavaha Srotodushti)	76%
Aharaja Nidana (Shita Ahara)	93.33%
Viharaja Nidana (Vegavidharana)	80%
Manasika Bhavaja	80%
Raja- Dhuma Nidana (Dust)	83.33%
Chief Complaint (*Shwasa Vega, Ativege Kasate, Kapha Nishthivanam*)	100%
Associated Symptoms (*Pinasa*)	100%

- **RESULTS**

Wilcoxon matched-paired signed-ranked test was applied to evaluate effect of therapy in individual group for subjective criteria. Mann –Whitney U-Statistic test applied for comparative effect of therapy in both group. Overall effect of therapy on each scale was calculated with reference to percentage improvement in all symptoms. Paired‘t’ test & Unpaired‘t’ test was applied in both groups for objective criteria. The obtained results have been interpreted as:

Table 4: Effect on chief complaints of Group A.

Symptoms	N	Mean		D.F.	% Relief	W	P	S
		BT	AT

- **DISCUSSION**

The fundamentals of *Ayurvedic* pharmacology are capable to give a better scientific lead in mode of drug action. Pharmacology of *Ayurveda* is based on the theory of *Rasa, Guna, Virya,*

Vipaka and *Prabhava* which were the simplest parameters in those days to find out the action of the drug. *Samprapti Vighatana* is said to be the treatment. Therefore the action of a drug means to dismantle the *Samprapti Ghatakas* of the disease. Hence to explain the mode of action of a drug means to establish a relationship between the *Samprapti Ghatakas* of the disease and pent fold principles of *Rasa, Guna, Virya, Vipaka* and *Prabhava* of a drug.

Group A - *Devadarvyadi kwatha* was prepared by mixing equal quantities of 6 drugs i.e. *Devadaru, Vacha, Vishva, Vyaghri, Kataphala* and *Pushkaramoola.* The *Devadarvyadi Kwatha* in *Tamaka Shwasa* is expected to work on *Pranavaha-Udakavaha-Rasavaha* and *Annavaha Srotasa* and should provide *Dipana-Pachana, Vatanulomana, Anulomana, Vata-Kaphahara* property. All drugs of *Devadarvyadi Kwatha* has *Kaphashamaka* property by 83.33%, 83.33% *Tikta* and *Katu Rasa* respectively, 66.66% *Tikshna Guna*, 83.33% *Katu Vipaka. Vatashamaka* property by 33.33% *Snigdha Guna*, 100% *Ushna Virya* and 16.66 % *Madhura Vipaka*, 100% *Laghu Guna.*

Group B - *Vasadi kwatha* was prepared by mixing equal quantities of 8 drugs i.e. *Vasa, Dhanyaka, Haridra, Guduchi, Bharangi, Pippali, Sunthi* and *Kantakari. Vasadi Kwatha* was having *Katu Rasa, Tikta Rasa, Ushna Virya, Katu Vipaka* and *Kapha- Vata Shamaka,* properties which are effective in antagonizing the *Tamaka Shwasa Roga.* Here, in *Vasadi Kwatha, Vasa* have the property of *Kaphaghna & Kaphanisaraka* by *Tikta Rasa, Katu Rasa, Ushna Virya, Katu Vipaka* and *Kapha-Vata Shamaka* properties in nature. All drugs of *Vasadi Kwatha Yoga* has 77.77% *Kapha-Vatashamaka* and 77.77 % *Ushna Virya* property. This *Yoga* is dominated by 66.66% *Katu Rasa* and *Tikta Rasa*, so this *Yoga* has *Kapha Shamaka* Property by 66.66% *Katu Rasa*, 66.66% *Tikta Rasa, 55.55% Katu Vipaka* and *Vatashamana* property by 11.11% *Madhura Rasa*,77.77% *Ushna Virya* and 44.44% *Madhura Vipaka.* This is essential for treatment of *Tamaka Shwasa.*

By combine action of all these drugs improves *Jatharagni* as well as *Dhatvagni*. After the quality and quantity of *Rasa* and *Rakta Dhatu* improves, due to *Srotoshodhana* property of drugs, *Srotosanga* is decreased and *Dhatu* again Nourish all parts of body.

- **Discussion on overall effect of therapy**

Group-A:- Complete remission was not found in group of *Devadarvyadi Kwatha* though 6.66% of cases found marked relief while 46.66% of cases found moderate relief and mild relief in this group.

Group-B: - In this group also complete remission and marked relief was not found while 60% of cases found moderate relief and 40% of cases found mild relief.

No any patient was found with complete remission in both groups because of *Yapya* nature of *Tamaka Shwasa.*

The overall assessment considering the improvement in *Rogabala*, *Agnibala Dehabala*, and *Chetasabala* considering all the parameters outlined in the assessment criteria were 53.46%, 63.38, 52.77%, 42.58 respectively in Group A and 49.022%, 55.07%, 43.33%, 46.58% respectively in Group B.

So, Group A shows better result compare to Group B.

- **CONCLUSION**

Subsequent to methodical analysis, it may be concluded that *Devadarvyadi Kwatha* and *Vasadi Kwatha* are effective in the management of *Tamaka Shwasa* when *Doshas* are in morbid stage; and it can be adopted at any time when the patient needs. The *Kapha-Vatahara* drug used in the present study marvelous effect shows on *Tamaka Shwasa.*

- Comparing both Group A and B, in Group A total improvement was 53.37% and in Group B total improvement was 48.86%.
- At the end of this study conclude that null hypothesis (H0) is rejected and alternative hypothesis (H1) is accepted. i.e. *Devadarvyadi-Kwatha* will be more effective than *Vasadi-Kwatha* in management of *Tamaka Shwasa*.

ABSTRACT

Rasashastra and Bhaishajya Kalpana is the branch of Ayurved commonly termed as paraclinical branch which deals with production and standardization of Ayurvedic formulations. Rasaushadhis have always been considered a boon to these formulations due to their quick action, low dose, higher palatability and action even in dreadful conditions. Kharaliya Rasayan is the first type of Rasaushadhi which is comparatively easier to prepare and hence most extensively used by Ayurved practitioners in clinical practice. Hridayarnava Rasa is one such Kharaliya Rasayan which is found to be effective in ailments related to Heart. It has been extensively studied through various aspects. This paper aims to put forth its conceptual review in a critical format. As much as 9 books give reference of Hridayarnava Rasa, however the contents are more or less identical. Some texts opine to use it in all types of Heart diseases while some advice it in only Kapha Pradhan Heart disease. The design of Hridayarnava Rasa is comparatively easier to understand due to less number of contents and will definitely be helpful to understand larger formulations used in our day to day Ayurved clinical practice.

Keywords: Hridayarnava Rasa, Rasaushadhis, Kharaliya Rasayan, Heart diseases

INTRODUCTION –

Ayurved is termed as the science of Life. Moreover it is the way of leading a healthy life. As clearly depicted in its aims, the primary motto is always to keep the healthy in balanced state and then treat him if at all needed. But as days passed, the secondary motto has gained more significance as we today are less aware of being healthy all the time. The ignorance towards the basic considerations regarding our Prakruti, Kala, Bala, Dosha, Dushya, Mala, Agni, Vaya etc. which have to remembered each and every time have led to diseases now-a-days termed as Life Style Disorders. Diabetes, Hypertension, Obesity, Heart diseases, Stroke, Cancer etc. are some of the leading examples. According to the WHO, non-communicable diseases (NCD's) kill 41 million people each year, equivalent to 71% of all deaths globally[1]. Cardiovascular diseases account for most NCD deaths i.e. 17.9 million people die annually due to heart diseases worldwide[2]. As Ayurved is the science of life, we can come forward with solution to this ever increasing problem. This may come in the form of life style changes and also medicines. Hridayarnava Rasa is one such medicine which can be extensively used in management of Heart diseases i.e. Hridroga. It is an example of Kharaliya Rasayan and has few contents which are easily available. Kapha dosha according to Ayurved or obstructive pathology according to modern science is considered a prime pathological entity in Heart diseases.

METHOD

As much as 9 texts give reference of Hridayarnava Rasa with the same contents with changes in proportions or anupana in some instances. All the references have 3 main ingredients and 2 bhavana dravyas.

Table 1: List of ingredients of Hridayarnava Rasa

Sr. No.	Sanskrit Name	English Name	Part used	Parts taken
1.	Shuddha Parada	Mercury	Purified form	1
2.	Shuddha Gandhak	Sulphur	Purified form	1
3.	Tamra Bhasma	Copper	Incinerated form	1
4.	Triphala	3 Myrobalans	Fruits Decoction	Q.S.
5.	Kakmachi	Solanum nigrum	Leaves juice	Q.S.

Preparation

The ingredients as shown in **Table 1** are to be collected and authenticated. Parada and Gandhak should be purified. Tamra should be purified and incinerated by the process and Marana and has to be used only after it passes all the bhasma pariksha especially Amla pariksha. The herbal drugs viz. Triphala and Kakmachi should also be authenticated before use. Contents no. 1 to 3 are to be mixed properly using a Khalwa yantra. Triphala kwatha should be prepared for 1 bhavna to be given to the mixture. Kakmachi swaras should be prepared for the final bhavna process. The final product will have blackish color and should be stored in air tight container.

Dose

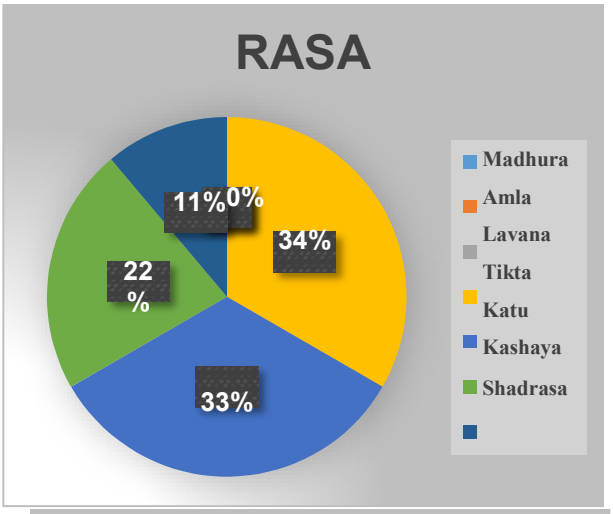
2 doses are found related to Hridayarnava Rasa in texts. One is "Chana matra"[3] which is translated to "Rakti matra" i.e. 120 to 125 mg dose. While Rasatarangini, the latest book on Rasashastra indicates "Gunjapada"[4] i.e $1/4^{th}$ Gunja or Rakti dose which comes to 30 to 31.25 mg. However dose fixation should always be done after proper examination of all the Dashavidha parikshas i.e. Dushya, Desha etc[5].

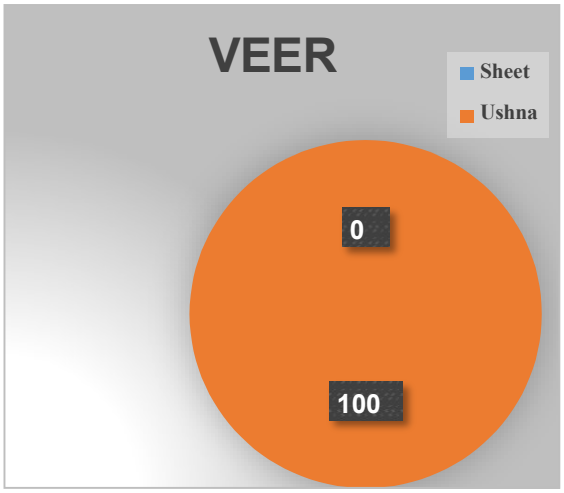
Anupana

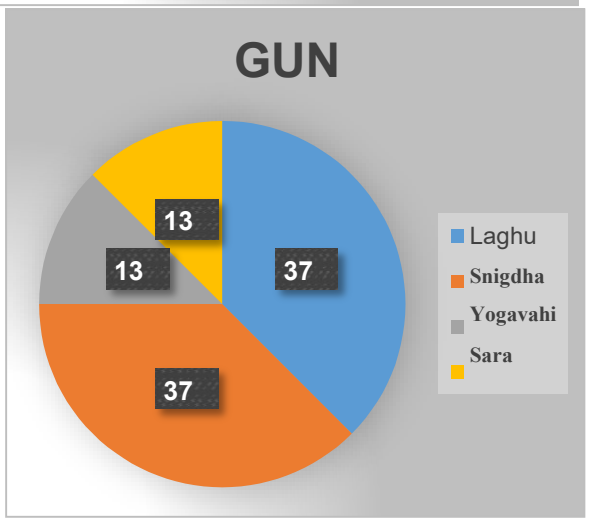
Out of 3 different references, 2 do not give any specific anupana. However, reference from **Rasachandanshu** gives a special kwatha as anupana for Hridayarnava Rasa. 1 karsha of Kakmachi is to be added to 1 pala of Triphala. 32 tolak water is to be added to this mixture and it should be reduced to $1/8^{th}$ proportion by mild heating. This 4 tolak (48 ml) dose is to be used as anupana for Hridyarnava Rasa.

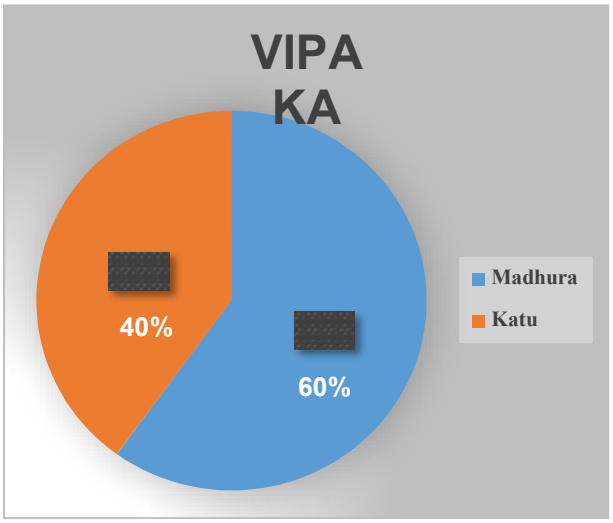
Table 2: Rasapanchak of ingredients of Hridayarnava Rasa

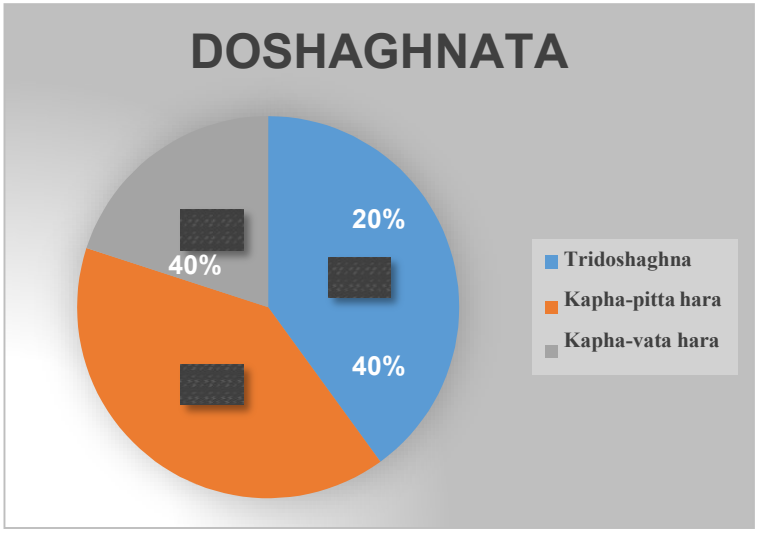
Sr. No.	Content	Rasa	Guna	Veerya	Vipaka	Karma
1.	Shuddha Parada	Shadrasa[6]	Yogavahi, Snigdha	Ushna	Madhura	Tridoshaghna, Rasayan, Vrishya, Balya, Sarvamayahar
2.	Shuddha Gandhak	Katu	Laghu	Ushna	Katu	Agnikari[7], Veeryavriddhi, Kushthahara etc.
3.	Tamra Bhasma	Tikta, Kashaya	Snigdha	Ushna	Madhura	Vishahara[8], Lekhana, Kapha-pitta rogahar
4.	Triphala Kwatha	Pancharasa (except lavana rasa)	Laghu	Ushna	Madhura	Rasayan, Kaphapitta hara, Ropan, Kleda, Meda, Meha nashak etc[9].
5.	Kakmachi Swaras	Tikta, Katu	Sara, snigdha, laghu	Ushna	Katu	Tridoshanghna, Swara-shukra kar, Rasayani etc[10].











Properties of Hridayarnava Rasa –

Rasa – Katu, Tikta Guna – Laghu, snigdha Veerya – Ushna Vipaka – Madhura

Karma – Rasayan, Lekhana

Hridayarnava rasa may be acting by virtue of its ushna veerya in heart diseases. It may be used in all types of heart diseases, however it may best act in Kaphaja hridroga due to the presence of contents like Tamra bhasma and Triphala kwatha bhavna.

DISCUSSION

Kharaliya rasayana are the most commonly used Rasayana. They are easier to prepare, require less dose and are palatable with more patient acceptability. Being in powder form, they are easily absorbed in the human body and start acting from the oral cavity itself. All the drugs are ushna veerya, making it the ideal drug of choice in Kaphaja Hridroga especially. Major drugs are Rasayan, hence may be used for a longer effect with continuous monitoring. The preclinical studies on anti-hyperlipidaemic activity of Hridayarnava Rasa[11] also show promising results on blood lipid levels which are considered as the prime cause of atherosclerosis leading to many further complications. Clinical evaluation of Hridayarnava Rasa[12] also showed promising results making it eligible enough to be used in patients of Heart diseases.

The reference of Rasatarangini advises to add Tamra bhasma in twice[13] the proportion of Parada and Gandhak. This may be the reason, he has reduced the dose to 1/4th gunja as compared to the previous books. Rasavagbhat also gives another formulation named as Kajjala Yoga[14] which has the same contents, but it has to be prepared in valuka yantra keeping it in sharava samputa.

Rasendrachintamani describes a similar formulation called Swacchand bhairava rasa with same constituents in Jwara Chikitsa adhyaya. He also describes Pliharnava rasa whose name matches with Hridayarnava rasa but is to be used in spleen disorders.

CONCLUSION

Hridayarnava Rasa is of the best rasayana prescribed to Hridroga patients. It has lesser contents which are easily available everywhere. The genotoxicity study done on Hridayarnava Rasa[14] also has shown no untoward effect on animals. Thus Hridayarnava Rasa can definitely act as a boon to the ever increasing patients of heart diseases globally especially in India where the number is peaking day by day.

CAUTION

Contents like Parada and Gandhak should be authenticated and thoroughly purified before using. Tamra bhasma should also be prepared with utmost care and all bhasma pariksha should be carried out before adding to the formulation.

ABSTRACT

The present article deals with the concept of *Dravya Pariksha Vidhi* explained by *Acharya Charak* and their challenges like Adulteration, Substitution & Modern Guidelines of standardization of drugs etc. Which plays an important role in the identification, authentication, and yielding of good quality of required drugs along with preserving the natural resources. In 20th and 21th - century people become aware of the challenges of synthetic drugs, which made the world shift towards Ayurveda that result in more usage of Ayurvedic medicines, which created an increased demand for raw material. So to fulfil the demand the fast drop-off started in the natural resource. Plants growing in high altitude regions, many of them became endangered and rare, as well as costly. Some drugs like *Vatsnabh* (*Aconitum Chasmanthum* stapfex. Haimes), *Kutki* (*Picrorhiza kurroa* Royle ex Benth), *Kustha* (*Saussurea lappa* C.B.Clarke), *Riddhi* (*Hobenariainte media* D. Don), *Vriddhi* (*Habenariaedge worthii* Hook.f.ex.Collett), *Kakoli* (*Roseea purpurrea* Smith), *Kshirakakoli* (*Lilium polyphyllum* D. Don), *Jeevaka* (*Crepipiuma cumina* tum D. Don. Szlach.), *Meda* (*Polygonatum verticillatum* Linn.) Allioni), *Mahameda* (*Polygonatum cirrhifolium* (wall.) Royal) and (*Polygonatum Vertecillatum* Alloi), *Rakta Chandana*, *Sandal Surkh* (*Pterocarpus santalinus* Linn.), *Sweta Chandana* (*Santalum album* Linn.), *Kesar*(*Crocus sativus* Linn.) *etc*. completely entered the endangered zone and due to incorrect identification, collection intentionally or unintentionally, Herbal adulteration has become common malpractices in herbal raw material trade. Due to the addition of spurious drugs, faith in Ayurvedic medicines for their results has declined. So, it is a need of the hour for proper identification of drugs through standardization techniques along with preserving our natural resources. As well as to overcome these problems the Knowledge of *Vrikshayurved* is

also essential to get the better yield of the requirement along with proper plant care to fulfil the required needs genuinely. The biggest advantage of applying these methods is that we could find *Anukta dravya* (Extrapharmacopieal) new drugs, *Pratinidhi dravya* (Substitute) and help to find out the properties (Raspanchak, Exact pharmacological action) of adulterated drugs in the view of *Ayurveda*, like *Rasapanchaka, Guna, Karma, Prabhav*, etc. and thus, facilitate its use in Ayurvedic therapeutics.

INTRODUCTION

Ayurveda which literally means "The science of Life" is one of the most ancient medical sciences of the world. *Ayurveda* advocate a complete promotive, preventive and curative system of medicines. For achieving these benefits of *Ayurveda* four limbs of treatment are described and known as *Chikitsa Chatushpad*.

Among those *Chatushpaad Bheshaj/Dravya* is recognized as an important tool which should be known by *Bhishak* in treatment aspects. Hence it is known as *Bheshaj*. *Bheshaj* is essential in case of *Dravyabhut Yuktivyapashray Chikitsa*. *Aacharyas of Ayurved* gives importance to this because success of treatment depends on this factor, without this *Bhishak* is unable to treat patient.

Another example of importance given to *Bheshaj* is the concept of *Trisutra. Aacharya Charak* explained the concept of *Trisutra* i.e. *Hetu sutra, Linga Sutra* and *Aushad Sutra*. By this we understand how much *Dravya* is important to *Ayurved*.

In the current era the proper results are not achieved in *Dravyabhut chikitsa* due to more adulteration and substitution either intentionally or unintentionally or due to lack of medicine.

Hence standardisation of *Dravya* and adding of new drugs in *Ayurved* is a need of present situation, before use of drug the addition of new drug can be done by concept of *Bheshaj Pariksha Vidhi* of *Charak Samhita*.

Acharyas of *Ayurveda* have allowed the skilful use of similar *Dravyas* which are not explained by them in case of non-availability of the one mentioned in the text. Thus, in *Nighantu* period followed this concept and studied new drugs and explained them in their text. Thus, many drugs from other healthcare systems or which were not found in India were later assimilated in *Ayurveda*.

This has led to new additions. For example, *Aakarkarabh* and *Kumari* were originally from African region; *Chandrashur* and *Madyantika* were from Faras region (now Egypt) but we find their references as well as elaborate description in Classical texts of *Ayurveda*.

Thus, following this tradition, we must find out such commonly used as well as a folk medicine, which do not have mention in *Ayurvedic Samhitas*. Such time-tested drugs are needed to be studied by *Dravyaguna* researchers. In *Ayurveda*, this can be attained with the help *Dravya Pariksha Vidhi* in *Vimansthana* of *Charaka-Samhita*.

AIMS AND OBJECTIVES

- This article aims at proper understanding the concept of *Dravya Pariksha Vidhi*.
- The study is carried out with an aim to understand it thoroughly and find its applicability for standardization of adulterants and substitutes of drugs.
- Applicability for finding new drugs which can be used for *Chikitsa*.

MATERIALS AND METHODS

The study was carried out after studying Classical text like *Charak Samhita*, *Sushrut Samhita, Bhavprakash Nighantu*, various textbooks of *Dravyagun Vigyan* and online medical database and published research papers etc. related to the concept of Adulteration, Substitution and *Dravya Pariksha Vidhi*.

Concept of adulteration[1,2]

Adulteration it is a practice of substituting the original crude drug partially or fully with other substances which is either free from or inferior in therapeutic and chemical properties or addition of low grade or spoiled drugs or entirely different drug similar to that of original drug substituted with an intention of enhancement of profits.

1. **Types of adulterants**

1.1 Substitution with substandard commercial varieties: Adulterants resemble the original crude drug morphologically, chemically, therapeutically but are sub-standard in nature and cheaper in cost. E.g. Strychnos nux vomica seeds are adulterated with Strychnos nux-blanda or Strychnos potatorium seed.

1.2 Substitution with superficially similar but inferior drugs: Inferior drugs may or may not have any chemical or therapeutic value. They may resemble only morphologically, so due to its resemblance they are used as adulterants. Eg. Cloves with mother cloves.

1.3 Substitution with artificially manufactured substance: The drug is adulterated with the substance which has been prepared artificially. The artificially manufactured substance resembles the original drug. E.g. paraffin wax is adulterated with yellow bee wax.

1.4 Substitution with exhausted drug: The same drug is admixed but that drug is devoid of medicinally active substance as it has been extracted already. Mainly volatile oil containing drugs like clove, coriander, fennel, caraway are adulterated by this method.

1.5 Substitution with synthetic chemicals to enhance natural character: Synthetic chemicals are used to enhance natural character of the exhausted drug. Examples: citral is added to citrus oils like lemon and orange oils.

1.6 Presence of vegetative matter of same plant: Some miniature plants growing along with the medicinal plants are added due to their colour, odour, and constituents.

1.7 Harmful adulterants: Some are harmful materials as the adulterant, are collected from market waste materials and admixed with the drug. It is done for the liquid drugs.

1.8 Adulteration of powders: The drugs which are in the form of powders are frequently adulterated. Examples: dextrin is added in ipecacuanha, exhausted ginger in ginger, red sanders wood in capsicum powder and powdered bark adulterated with brick powder.

2. Reason of adulteration

2.1 Confusion in vernacular names: In *Ayurveda*, *Parpatta* refers to Fumaria parviflora Lam. In *Siddha*, *'Parpadagam'* refers to Mollugo pentaphylla L. Owing to the similarity in the names in traditional systems of medicine, these two herbs are often interchanged or adulterated or substituted.

2.2 Lack of knowledge about authentic source: *Nagakesar* is one of the important drugs in *Ayurveda*. The authentic source is Mesua ferrea L. However, market samples are adulterated with flowers of Calophyllum inophyllum Linn. Though the authentic plant is available in plenty throughout the Western Ghats and parts of Himalayas, suppliers are unaware of it. There may also be some restrictions in forest collection. Due to these reasons, C. inophyllum Linn. (Which is in the plains) is sold as *Nagakesar*.

2.3 Similarity in morphology: Mucuna pruriens (L.) DC. is adulterated with other similar Papilionaceae seeds having similarity in morphology. M. utilis (Ridl.) H.J.Lam (sold as white variety) and M. deeringiana (sold as bigger variety) are popular adulterants. Apart from this M. cochinchinensis (Lour.) Spreng., Canavalia virosa (Roxb.) Wight & Arn. and C. ensiformis (L.) DC. are also sold in Indian markets..

2.4 Lack of authentic plant: Hypericum perforatum L. is cultivated and sold in European markets. In India, availability of this species is very limited. However, the abundant Indo-Nepal species H. patulum, sold in the name of H. perforatum L. Market sample is a whole plant with flowers and it is easy to identify them taxonomically. Anatomically, transverse section of H. perforatum L. stem has compressed thin phloem, hollow pith and absence of calcium oxalate crystals. Whereas H. patulum has broader phloem, partially hollow pith and presence of calcium oxalate crystals.

2.5 Similarity in colour: It is well known that with course of time, drug materials get changed to or substituted with other plant species. *'Ratanjot'* is a recent day example. According to the suppliers and non-timer forest product (NTFP) contractors, in the past, roots of Ventilago madraspatana Gaertn. were collected from Western Ghats, as the only source *'Ratanjot'*. However, that has not been practiced now. It is clearly known that Arnebia euchroma (Royle) I.M.Johnst is the present source. Similarity is in yielding a red dye, A. euchroma (Royle) I.M. Johnst substitutes V. madraspatana Gaertn. Recently V. madraspatana Gaertn is not found in market. Whatever is available in the market, in the name of *Ratanjot* is originated from A. euchroma (Royle) I.M. Johnst.

2.6 Careless collection: Some of the herbal adulterations are due to the carelessness of herbal collectors and suppliers. Parmelia perlata (Huds.) Ach. is used in *Ayurveda*, *Unani* and *Siddha*. It is also used as grocery. Market samples showed it to be admixed with other species (P. perforate Bory.).

3. Concept of Substitution

Substitution is a replacement of equivalent drugs in place of original drugs on the basis of similar pharmacological actions and therapeutic uses. In Ayurveda, substitution is described by the name of Abhava Pratinidhi Dravya. During Samhita Period concept of adulteration and substitution was not existed but later on this practice come in existence. But Vagbhatta has mentioned that the dravya having similar Ras (taste), Guna(characteristic), Veerya (potency) and Vipaka should be used in absence of each other. So Abhava Pratinidhi Dravya is a replacement of original drug basically having similar Rasa, Guna, Veerya, Vipak and mostly on Karma. Description of Abahva Pratinidhi Dravyas are mentioned in Bhavaprakash Nighantu, Yogratnakar and Bhaishajya-Ratnawali.17-19 There are 47 drugs of plant origin (Sthavar Dravya), 2 drugs of animal origin (Jangam Dravya), 7 drugs Minerals-Metals origin (Bhoumya Dravya) and 5 food materials (Ahara Dravya) mentioned for Abhava Pratinidhi Dravya in Bhavaprakash Nighantu.[3]

4. Types of substitution[4]

4.1 Using totally different drug: *Bharangi* (Clerodendrum indicum L. Kuntze.) and *Kantakari*. *Bharangi* has bitter taste; *laghu* (light*), ruksha* (unctuous) *guna* (quality) and has *Kapha-vatahara* property. While *Kantakari* (Solanum xanthocarpam) has *katu vipaka* (pungent digestion) and *ushna virya* (hot potency). Both C. indicum L. Kuntze and S. xanthocarpam have shown antihistaminic activity. Both C. indicum L. Kuntze and S. xanthocarpam are commonly used in the diseases related to the respiratory system, which are usually associated with release of histamines and other autacoids.

4.2 Substitution of the species belonging to same family: The Datura metal L. and Datura stramonium L. can be considered here. Chemical constituents are alkaloids, scopalamine, atropin, hyocyamin, lyoscine. The alkaloids are proved as bronchodialatory and inhibitor of secretion of mucous membrane. The alcoholic extract of D. metal L. shows anthelmentic activity the alkaloid present in both the species are well proven bronchodilators and also, they inhibit the secretion of mucous membrane of the respiratory tract. Thus, as far as the diseases of the respiratory tract are concerned both D. metal L. and D. stramonium L. are beneficial, while as D. metal L. would be a better choice as it is a proven anthelmintic.

4.3 Using different species: Two types of *Gokshura* viz. Tribulus terrestris L. (Zygophylaceae) and Pedalium murex Linn. (Pedaliaceae) of which, T. terrestris L. has the chemical constituents like chlorogenin, diosgenin, rutin, rhamnose and alkaloids. While P.murex L. has sitosterol, ursolic acid, vanilin, flavonoids and alkaloids. Both the species are proved for nephroprotective, lithotriptic, diuretic and hepatoprotective activities. The clinical conditions where Gokshura is indicated i.e. *Mutrakrucchahara* (renal disorder), *Ashmarihar* (urinary calculi), *Prameha* (diabetes) etc, both T. terrestris L. and P.murex L. appear to be appropriate.

4.4 Using different parts of the plant: The root of Sida cordifolia Linn. and the whole plant of Sida cordifolia Linn. can be considered. Root has the chemical constituents such as sitoindoside, acylsteryglycoside, while the whole plant has alkaloid, hydrocarbons, fatty acids and ephedrine. Various extracts of the whole plant showed antibacterial, antioxidant, hypoglycemic, hepatoprotective and cardio tonic activities. Though it is the root which is mentioned as officinal part of S. cordifolia Linn. in the classics as *Balya* (promotes strength), *Shotahara* (reduce inflammation) etc. Modern researches prove that even the aerial parts are also equally effective.

4.5 Due to same in action: Embelica officinalis Gaertn. shows antioxident, hepatoprotective, antimicrobial, hypoglycemic and hypolipidemic action. Semecarpus anacardium Linn. shows anti-tumour, hypotensive, anticytotoxic and anticancerous properties etc. Both *Amalaki* and *Bhallataka* are *Rasayana* (rejuvenator) drugs. In current practice the *Rasayana* formulations are being employed as an adjuvant therapy in Chronic as well as Malignant diseases. *Amalaki* can be employed as *Rasayana* in Chronic debilitating diseases like bronchial asthma, diabetes etc, while *Bhallataka* would be better choice in malignant conditions, both in solid tumours and in leukaemia.

Reasons for substitution[5]

1) Non-availability of the drug: Sometimes there may be non-availability of drugs. E.g: *Astavarga dravyas* (group of 8 crude drugs).
2) Cost of the drug: It is very essential component for economy of the drug.eg. As *Kumkum* being costly drug can be substituted by *Kusumbha*.
3) Adverse reaction of the drug: Due to the adverse reaction of the drug on patient there is necessity of substitution. *Vasa* having abortificiant activity its use is limited for pregnant women besides that *Laksha, Ashoka* can be substituted.
4) Shelf life of the drug: Shelf life of the drug is also another reason for substitution e.g. no availability of old jagerry, new jagerry after heating in sun rays for four hours can be used.
5) Uncertain identity of the drug: Herb *Lakshmana* and different species such as Aralia quinquefolia L. and Ipomea sepiaria Koienig ex Roxb. etc. are considered.
6) Seasonal availability of drugs: Due to limited availability of the drug round the year, other available drugs, having similar actions are used. E.g. Trianthema portulacastrum Linn. can be used in seasonal absence of Boerhavia diffusa Linn.

Concept of bheshaj pariksha vidhi[6]

तस्यापीयं परीक्षा- इदमेवंप्रकृत्येवंगुणमेवंप्रभावमस्मिन देशे जातमस्मिन्नृतावेवं गृहीतमेवं निहितमेवमुपस्कृतमनया च मात्रया युक्तमस्मिन् व्याधावेवंविधस्य पुरुषस्येवतावन्तं दोषमपकर्षत्युपशमयति वा, यदन्यदपि च एवं विधं भेषजं भवेतच्चानेन विशेषेण युक्तमिति ॥

(च. वि. 8/87)

The standardization techniques were described in *Vimansthana* of *Charaka-Samhita,* by *acharya charaka*

1) ***Edam evam prakritim:*** *Dravya Prakriti*
2) ***Evam gunam*****:** Physical-*Rasa, Veerya, Gurvadi Gunas* and chemical Properties.
3) ***Evam prabhavm*****:** Therapeutic actions.
4) ***Asmin deshe jatam*****:** Botanical distribution
5) ***Ritu eva grihitam*****:** Time and method of collection.
6) ***Nihitam*****:** Method of preservation.
7) ***Upaskritam*****:** *Sanskar*, Pharmaceutical processing for its preparations.
8) ***Matra*****:** Dosage
9) ***Vyadhi*****:** Various diseases in which drug can be therapeutically used.
10) ***Evam vidham purushasya*****:** Clinical trials

1) *Edam evam prakritim*: (*Dravya prakriti*)

- It includes name, nature and morphology of *Dravya*. The biological nomenclature description of *Dravya* is described by *Narahari Pandit* in *Raj- Nighantu* as follows.[7]

1. *Rudhi* (Traditional use): *Aatarusaka, Tuntuka*
2. *Prabhava* (Effect): *Krimighna, Hayamara*
3. *Desyokti* (Habitat): *Magadhi, Kalinga*
4. *Lanchana* (Morphological character): *Rajiphala, Chitraparni*
5. *Upama* (Simile): *Salaparni, Ajakarna*
6. *Virya* (Potency): *Usana, Sita*
7. *Itarahvaya* (Due to other factors): *Sakravaha, Kakahva*

2) *Evam gunam*

The *Guna* of a *Dravya* is based on *Pancha-bhautikatwa* and on *Rasadi* properties.

A. On the basis of *Pancha-bhautikatwa*

Panchabhautik constitution of *Dravya* can be determined on the basis of predominant *Rasa* present in them as specific *Rasas* are having dominance of specific *Mahabhutas*.

Rasa	**Predominant *Mahabhuta* (Acco. to *Acharya Charak*)[8]**
Madhur	*Prithvi + Jala*
Amla	*Prithvi + Agni*
Lavan	*Jala+ Agni*
Katu	*Vayu + Agni*
Tikta	*Vayu + Akash*
Kashay	*Vayu + Pruthvi*

B. On the bases of *rasadi* properties

The term *Rasadi* properties refers to *Rasa, Guna, Veerya, Vipaka* and *Prabhava*. Which are as follows.

(i) Determination of *rasa*[9]

Rasa of a drug is gustatory appeal. It is told by *Acharya Charaka* that

"रसो निपाते द्रव्यानाम"

(च. सू.-26/66)

I.e. *Rasa* is perceived through the contact of *Dravya* with gustatory sense organ and is called gustatory perception. This is the best way to know about the *Rasa* of a *Dravya.*

- General sense of taste: By direct perception (*Pratyaksha*)
- Specific sense of taste: By inference (*Anumana*)
- Experimental knowledge of taste: By authoritative statement

(ii) Determination of *gunas*[10]

The term *Guna* literally means the properties or qualities of any substance or *Dravya*. But in *Ayurveda* it means physicochemical or pharmacological properties of the *Dravyas*. *Shareerika Gunas* and *Paradi Gunas* are considered very important in the concept of *Bheshaj*.

(iii)Determination of *veerya*[11]

Veerya is known as potency of the *Dravya* which is known by *Pratyaksha*, *Anumana* as well as by both. The *Virya* of some *Dravya* is known from *Nipata* (*Pratyaksha* e.g. – *Maricha*) which comes in direct contact with tongue or skin, some *Dravya* from *Adhivasa* (*Anumana*) e.g.- *Anupa mamsa* and some by both *Adhivasa* and *Nipata* e.g.-*Maricha*.

Kriya	**Pramana**	**Examples**
Nipata (contact with body)	*Pratyaksha* (perception)	*Maricha (Tikshna)*
Adhivasa (stay in body)	*Anuman* (inference)	*Anupa mamsa*
Nipata- Adhivasa	*Pratyaksha- Anumana*	*Maricha (Ushna)*

Classification of *ashtavidha veeryas*

- *Sheeta Ushna*
- *Guru Laghu*
- *Snigdha Ruksha*
- *Mrudu Teekshna*

(iv)Determination of *vipaka*[12]

End product of a *Dravya* which is the outcome of digestion/ metabolism is known as *Vipaka*. In Ayurveda, *Vipaka* is associated with the *Rasa* i.e. a fixed *Vipaka* is associated with corresponding *Rasa*.

कटुतिक्तकषायाणां विपाकः प्रायशः कटु। अम्लोऽम्लं पच्यते स्वादुर्मधुरं लवणस्तथा ।।

(च.सु.-26/58)

Thus, it can be assessed by the knowledge of *Rasa*. *Vipaka* of a drug is inferred by its properties after it has undergone digestive and metabolic transformations. Thus, *Vipaka* can also be assessed by its action produced on *Doshas*, *Dhatus* and *Malas*. It can also be assessed on the bases of the available literary information, regarding its properties and actions. It would be based upon the *Trividha Vipaka Vada* of Ayurveda.

(v) Determination of *prabhava*

Prabhav is a unique action of a drug. It can be defined as an action of a *Dravya* which we cannot attribute to any of its *Rasapanchaka*. Such examples are very few and no test parameters are available for its assessment. It is applicable only in case of few drugs.

3) *Evam prabhavm*

Prabhava here stands for Specific Action of a Drug. It is the property of drug which is responsible for peculiar action.

रसवीर्यविपाकानां सामान्यं यत्र लक्ष्यते। विशेषः कर्मणां चैव प्रभावस्तस्य स स्मृतः।। (च.सू.-26/67)

Prabhava is also quoted as *Achintya virya*. According to *Charaka* drug action is possible by means of three aspects[13]

a. Dravya prabhava

b. Guna prabhava

c. Dravya guna prabhava

- In modern *Prabhava* can be correlated with ‘Pharmacodynamics’ i.e. effects of a drug on body systems are studied.

4) Asmin deshe jatam

Here *Desha* is considered, the area where *Dravya* or the herb is grown which can be called habitat. The habitat is made up of Panchamahaboota and varies from place to place. Some of

the plants are grown only in specific area. Some of the *Dravyas* may be found everywhere but still the properties and their active principles differ as per the area and the ecological conditions. As per classical texts *Dravya* should be collected from *Prashasta Desh.*

- As a general opinion *Acharya Sharangdhar* says that all *Ushna Virya Dravya* are to be collected from Vindhya hills and *Shita Virya* are to be collected from Himalayan ranges.[14]

- The land may be categorized on the basis of *Pancha mahabhuta* predominance and drugs for different purposes are to be collected from soil of different *Mahabhuta* dominance as mentioned by *Maharshi Sushruta*.[15]

Dravya	**Collecting place (predominant Mahabhuta)**
Virechan Dravya	*Prithvi* and *Jala Mahabhuta*
Vamana dravya	*Agni, Akasha, Vayu*
Ubhayaja dravya	*Soil* of all *Mahabhuta* predominant
Samana dravya	*Akasha Mahabhuta*

- Plant grown near temples, *Valmika* (anthill soil), *Kutsita* (*Bibhatsa sthana*), *Anupa* (marshy land), *Smashana* (burial grounds), *Usara pradesha* (saline soil), *Marga* (walking lanes), *Jantu Pidita*, *Agni Dagdha* and *Himavyapata* are unfit for therapeutic use.[16]

5) *Ritu grihitam*

In Ayurveda, *Prashasta Ritu* and *Kala* for drug collection i.e., season, time of collection and storage method are well described (C.K.1/10). for the effective results**.** Modern science also states that a standard quality drug can be obtained only if it is collected by Good Collection Practise

Plant part	**Classical view**[17]
Moola (root and rhizome)	*Grishma* and *Shishir* (summer and late winter)
Kanda (bulb)	*Sharad* (autumn)
Twak (bark)	*Sharad* (autumn)
Shakha- Patra (leaves and stems)	*Vasanta* and *Varsha* (spring & rainy season)
Pushpa (flowers)	A/c to flowering season
Phala (fruits)	A/c season of maturity of food
Bija (seed)	———
Saar (heartwood)	*Hemanta* (early winter)
Niryas (latex)	*Sharad* (autumn)

6) *Nihitam*

Preservation methods for drugs are very essential for future use in treatment. The medicinal drug should not come in contact with insects, instruments, smoke, sunshine, air, fire, water and bacteria. The containers like vessels, jars, drums, etc, should be in a way that these should not affect the properties of drugs. The drugs which are to be used in fresh form should not be preserved. Some of the drugs like honey, Piper longum L., Embelia ribes Burm.f. are used after preserving them for 1 year. The main aim of preservation of drugs is to maintain its potency by conserving its properties and actions. A preservation technique varies from sample to sample.

7) *Upaskrit*

Pancha vida kashaya kalpana has told in *Bheshaja Kalpana*, like *Swarasa*, *Kasaya*, *Kwatha*, *Hima*, *Fanta*. Further the derivatives of these *Kashasy Kalpana* are also mentioned, which may be for single drug or for compound formulation. The formulations are prepared to make the drug more potent, to preserve for longer time, palatable and to get effective results.

8) *Matra*

Sharangadara stated there is no specific dosage for everyone. To decide the dose individually *Kala-Agni-Vayah-Bala-Prakriti-Dosha-Desha* are to be considered. Then only the dose is finalized.[18]

Deciding the dosage of a drug plays an important role in the treatment. Dosage must be decided on the basis of *Vyadhi Bala, Agni Bala* and *Rogi Bala*.

9) *Vyadhi*

The physician with all the knowledge of the *Dravya shastra* and *Vyadhi* with his *Yukti* he has to choose/select proper *Dravya* to the particular disease. Single *Dravya* can be used in various diseases depending upon its signs and symptoms.

10) *Evam vidham purushasya*

After going through the details of the above-mentioned concepts, it is safe to administer on the person i.e. clinical trial.

In ancient period *Aacharyas* used to prepare the formulations by themselves as per the requirement instantly, starting from identification process till its preparation, Due to rich heritage of natural resources. But in current era it is difficult. As well as adulteration and

substitution is also increased. So before going to clinical trial animal experiment has to be conducted by following the standardization techniques.

Analytical evaluation techniques in herbal drug[19]

The modern guide lines of standardization of drugs, to prove the identity and purity, the criteria such as the macroscopic evaluation, organoleptic evaluation, microscopic evaluation, chemical evaluation, physical evaluation, biological evaluation, chromatographic techniques, adulteration, contaminants, moisture, ash content and solvent residues have to be checked. The correct and proper identity of the herbal drug is of prime importance in establishing the quality control of herbal drugs.

Macroscopic and organoleptic evaluation

The organoleptic evaluation of a drug by means of sense organs or macroscopic evaluation is the evaluation of the drug by its colour, odour, taste, shape, size and touch, which is based on the study of morphological and sensory profile of the drug.

Microscopic evaluation

This examination of drug is used to identify the organized drugs by their histological features with the help of microscope. For detecting various cellular tissues, trichomes, stomata, starch cells, calcium oxalate crystals, etc.

Chemical evaluation

The qualitative chemical tests are used to identify certain drugs to test their purity, isolation, active constituents, purification and for detection of adulterants.

Physical evaluation

These include moisture content, specific gravity, refractive melting point, viscosity and solubility in different solvents. These criteria are useful in identification of constituent drugs present in the plants.

Biological evaluation

Some drugs have specific biological and pharmacological activity which is utilized for their evaluation especially in plant extract. Here the experiments are carried out on both intact and isolated organs of living animals. With the help of bioassays, strength of drug can be evaluated.[19-21]

Chromatographic techniques

Chromatography may be preparative or analytical. The purpose of preparative chromatography is to separate the component of a mixture for later use, and is thus a form of purification. Analytical chromatography is done normally with smaller amount of material and is for establishing the presence or measuring the relative proportions of analytes in a mixture. The techniques like

Column chromatography

Planar chromatography

Gas chromatography

Liquid chromatography

Supercritical fluid chromatography

Ion exchange chromatography

Size-exclusion chromatography

Expanded bed adsorption chromatography and many more are used.

Along with the above mentioned standardization techniques, Knowledge of *Vriksyaurveda* is also an essential science to over the difficulties. *Vṛkṣāyurveda-Surapāla's* text deals with arbori-horticulture and gives considerable information on the importance of trees, soil types, selection of suitable land, soil characteristics, classification of plants, seed, sowing, planting, plant protection recipes, nourishment, types of gardens, locating groundwater, and bio-indicators to decide the suitability of raising specific crops, examination and treatment of seeds, digging of planting pits, different methods of irrigation, plant nutrition, fertilizers, diseases of trees and their treatment, the wonders of horticulture, plant conservation etc.

For treating disorders, *Surapāla* suggests using a number of plant species that we know today have antimicrobial properties, including mustard paste and milk. *Svātī, Hasta, Rohiṇī, Śravaṇa* and *Mūla* are considered to be good stars for planting trees. The distance between trees should be minimum twenty rods. If the tree does not bear fruit, the stem should be examined by cutting with a knife. Then mix powdered vermifuge seeds with ghee and smear it on the cut. Then water the tree. Watering the trees with fish-water will make them yield fruits more quickly. Mixture of Vermifuge seed, fish and rice is a good manure. This manure is a good remedy for all diseases of trees.[21] (*Agni Purāṇa Chapter 281*).

CONCLUSION

This study can be concluded that both *Dravya Pariksha Vidhi* as per *Ayurvedic* perspective and modern Pharmacognostic are important for evaluation and standardization of a drug or any formulation. But in this era, it is high time to have a control over both intentional & unintentional adulteration. Substitutes may be used as per the requirement but not the *Pradhan Dravya*. To protect critically endangered, rare and costly medicinal plant species there is a great demand of using cell culture techniques development, propagation, conservation, cultivation, motivate farming and growing of endangered, rare species for large scale farming. For getting good yield of the required needs from the plants the knowledge of *Vrikshayurved* is also very important this is the branch of science deals with knowledge of plant life, in all aspects. Genetic engineering in agriculture becomes more efficient and resilient. By considering all the above factors, we can meet today's needful demand by preserving our cultural health care heritage and traditional, *Shastra oushadhee* therapy drug development to provide traditional original medicinal plant-based standard quality products to our nation.

ABSTRACT

Haritakyadi Gutika is an important ayurvedic polyherbal formulation. It should be used in kasa (chronic cough), and shwasa (asthma). **Aim:** The objective was to exploit the standard manufacturing procedure (SMP) and quality standards of Haritakyadi Gutika. **Materials and Methods:** In this present study, Haritakyadi Gutika was prepared in three batches to produce SMP. **Results:** Ingredients of Haritakyadi Gutika in which average percentage yield of Haritaki Churna was 94.26%, Nagar Churna was 94.41%, Musta Churna 94.14 % and Guda Paka was 99.20%; Averagely 91% *Haritakyadi Gutika* was obtained from total ingredients. **Conclusion:** Pharmaceutical Standardization made re-genesis of drug and production of secure potent drugs and useful in scientific area of research in future.

KEYWORDS: *Haritakyadi Gutika*, *Churna* preparation, Standardization.

INTRODUCTION

Haritakyadi Gutika is an important formulation in Ayurveda under the category of Polyherbal Medicine mentioned in *Kasa* (Cough) *Chikitsa Prakarana* of *Chakradatta* 11th *Adhyaya.*[1]

Triumph by Ayurvedic Medicine was totally dependent on the quality of medicine prescribed to patient. In *Chatushpad*, All treatise of Ayurveda given importance to *Vaidya.*[2] An ancient time, *vaidya* used traditional method of preparation of medicine according to diseases. The herbal medication of Ayurved retrieve the Siddhant of ***'Sarvam Dravyam Panchbhautikam Asmin Arthe'.***[3] These *Haritakyadi Gutika* medicine was prepared by the method given in *Sharangdhar Samhita.*[4] The ingredients present in the *Haritakyadi Gutika* are *Haritaki churna (Terminalia chebula), Nagarchurna (Zingiber officinale), Musta churna (Cyperus rotundus), Guda (Saccharum officinarum).* As this yoga was indicated in *Kasa* (Chronic cough) *Chikitsa, Purana* (Old) *Guda* (Jaggery) was preferably used for present study. This *Gutika* also used in the treatment of *Shwasa* (Chronic asthma). The specific pharmaceutical homogenous mixture of these contents can result in a more significant formulation. Therefore the present study has been planned to standardize the method of preparation of *Haritakyadi Gutika* according to method explained in classical texts. *Vatak, Gutika, Vati, Modaka, Vatika, Pindi, Guda* and *Varti* are the synonyms of *vati.*[5] All these terminologies are used as synonyms for *vati* in different part of classics. *Gutika* is a rounded shaped pill being purposefully used for internal administration.

MATERIAL AND METHODS

Collection of raw materials.

Sr. No.	Raw Material	Latin Name	Part Used
1	*Haritaki*	*Terminalia chebula*	Fruit
2	*Nagar*	*Zingiber officinale*	Rhizome
3	*Musta*	*Cyperus rotundus*	Root
4	*Guda(Jaggery)*	*Saccharum officinarum*	-

Haritaki, Nagar, Musta and *Guda*were obtained from the local market of yeola, Dist. Nashik. Preparation of *Haritakyadi Gutika* with the reference of *Sharangadhar Samhita*, was carried out in the Department of Rasashastra & Bhaishajyakalpana, Matoshri Asarabai Darade Ayurved College, Babhulgaon, Tal-Yeola, Dist.-Nashik, Maharashtra.

Equipment Used

Khalwa (Stone Khalwayantra, Length 12 inch), Stainless steel container 3 litre capacity, Stainless steel tray (length – 24 inch, width – 24 inch), Ladle stainless steel length: 15 cm, Cloth: clean cotton cloth of 1 × 1 feet, measuring machine: 2 kg capacity, and gas burner with LPG cylinder (14.5 kg capacity) were used in making process of Gutika.

Pharmaceutical Preparation of *Haritakyadi Gutika*

Study was carried out in three stages

1) **Stage I** -*Haritaki*, *Nagar*, *Musta Churna* preparation.
2) **Stage II** - Liquefaction of *Guda* (Jaggery) as per symptoms of *Guda paka.*
3) **Stage III** - Preparation of homogenous mixture of all ingredients and making of *Haritakyadi Gutika*

Stage I

***Haritaki Churna* Preparation**

Ingredients :- Dry *Haritaki* Fruit - 100 g

Procedure :-Dried *Haritaki* checked for any external impurities then it taken and triturated into clean *khalwa yantra* and filtered through clean white cotton cloth to obtain very fine powder.[6]

Observation :-Brownish coloured *Haritaki Churna* was obtained.

***Nagar Churna* Preparation**

Ingredients :-Dry *Nagar* (Ginger) Rhizome 100 g.

Procedure :-Dried *Nagar* checked for any external impurities then it taken and triturated into clean *khalwa yantra* and filtered through clean white cotton cloth to obtain very fine powder.

Observation :-White or Slightly Brownish coloured *nagar* churna was obtained.

***Musta Churna* Preparation**

Ingredients:- Dry *Musta* root 100 g.

Procedure:- Dried *Musta* root checked for any external impurities then it taken and triturated into clean *khalwa yantra* and filtered through clean white cotton cloth to obtain very fine powder.

Observation:- Brownish coloured *musta* churna was obtained.

Stage 2 - Preparation of *Guda Paka*

After removal of external impurities, clean raw *Guda* should be taken in equal quantity of *churna* (about 300 g) into clean wide mouthed stainless steel vessel of 3 liter sizes. It is added with required 5 ml quantity of water, placed over mild fire and heated with frequent stirring.

Stage 3 -Preparation of homogenous mixture of all ingredients and making of *Haritakyadi Gutika*.

Preparation of homogenous mixture of all ingredients

When *Gudapaka* of suitable consistency was obtained then removed from fire and the fine powder of *haritaki*, *nagar*, *musta* was added one by one into the vessel containing *Guda paka*. Homogeneous mixture of all ingredients was formed.

Making of *Haritakyadi Gutika*

After Homogeneous mixture of all ingredients it left for self-cooling. After cooling of mixture, *Gutika* (Pills) were made by hand with equal shape, size and weight. The prepared *Haritakyadi Gutika* were later dried in shade and stored in airtight container.[7]

RESULT

Table No 1: Showing the result of *Haritaki Churna* Preparation.

Batch	Initial weight of raw *Haritaki* (g) (before cleaning)	Initial weight of raw *Haritaki* (g) (after cleaning)	Weight of obtained *Haritaki* churna (g)	Weight loss(g)	Yield (%)
I	100	98	93	5	94.89
II	100	96.5	91	5.5	94.30
III	100	94	88	6	93.61
Average	100	96	91	5.5	94.26

Table No 2: Showing the result of *Nagar Churna* Preparation.

Batch	Initial weight of raw *Nagar* (g) (before cleaning)	Initial weight of raw *Nagar*(g) (after cleaning)	Weight of obtained *Nagar* churna (g)	Weight loss(g)	Yield (%)
I	100	96	90	6	93.75
II	100	94	88.5	5.5	94.14
III	100	97	92.5	4.5	95.36
Average	100	96	90	5	94.41

Table No 3: Showing the result of *Musta Churna* Preparation.

Batch	Initial weight of raw *Musta* (g) (before cleaning)	Initial weight of raw *Musta* (g) (after cleaning)	Weight of obtained *Musta* churna (g)	Weight loss(g)	Yield (%)
I	100	94	89	5	94.68
II	100	92	86	6	93.47
III	100	96	90.5	5.5	94.27
Average	100	94	89	5.5	94.14

Table No 4: Showing the result of *Gudapaka*Preparation.

Batch	Initial weight of raw *Guda* (g) (before cleaning)	Initial weight of raw *Guda* (g) (after cleaning)	Quantity of water (ml)	Weight of obtained *Guda Paka* (g)	Weight loss (g)	Yield (%)
I	300	294	05	292	2	99.31
II	300	296	05	293	3	98.98
III	300	295	05	293	2	99.32
Average	300	295	05	293	2	99.20

Table No 5: Showing the result of mixing of component drugs of *Haritakyadi Gutika.*

Batch	Initial weight of *Haritakyadi Gutika* before drying (g)	Final weight of *Haritakyadi Gutika* after drying (g)	Weight loss (g)	Total percentage of *Haritakyadi Gutika* obtained
I	564	549	15	91.5
II	558.5	540	18.5	90
III	564	545	19	91
Average	562	549	17.5	91

DISCUSSION

As per classical texts of *Chakradatta, Haritaki, Nagar, Musta* equal amount of fine powder mixed with equal quantity of *guda* (jaggery) & prepared *Gutika* used in *kasa* (chronic cough) and *shwasa* (asthma) diseases.[8]

Properties of *haritaki* are light to digest, *ruksha* qualities, Astringent dominance five rasa (except *lavana* rasa), sweet after digestion (*vipak*) with hot potency[9] and properties of *nagar* are light to digest, *snigdha* qualities, pungent in taste, sweet after digestion (*vipak*) with hot potency[10] while properties of *mustak* are light to digest, ruksha qualities, bitter, pungent, astringent in taste, pungent after digestion (*vipak*) with cold potency.[11] Old /stored jaggery is light to digest (*laghu*), forms wholesome diet, doesn't block the channels, enhances digestive capacity, pacifies *pitta and vata*, sweet taste (*rasa*), aphrodisiac and vitalizes *Rakta* (i.e. improves haemoglobin).[12]

The pharmaceutical procedures used in this study are *churna* preparation, *guda paka* preparation, *gutika* preparation. Dry *haritaki, nagar, musta* dravyas were made into very fine powder as per reference of *Sharangdhar Samhita*.

In stainless steel vessel, *Gudapaka* made by the references present in *Sharangdhar Samhita* and fine powder of *Haritaki, Nagar, Musta* were mixed to this *Guda Paka* and homogeneous mixture was formed. After that *Gutika* were prepared later dried in shade & stored in airtight container.

Initially after preparation of *Haritakyadi Gutika* weight were found as per batch 564 g, 558.5 g, 564 g, average 562 g; then this *gutika* dried in shade again and measured weight again as per batch were found that 549 g, 540 g, 545 g& average 549 g weight. In total 3 batches of *Haritakyadi Gutika*, Batch I prepared 91.5% *gutika* from total components of drugs while batch II prepared 90% *gutika* and batch III prepared 91% *gutika* from given component.

CONCLUSION

Averagely 91% *Haritakyadi Gutika* was obtained from total ingredients and average 9% loss was found due to removal of external impurities, sticking to the vessel and moisture.

Pharmaceutical Standardization being an initial step towards standardization of any drug. So, it should be done with extreme precision. This leads to re-genesis of drug and production of secure potent drugs. It will be help to scientific researcher in future.

Conflict of Interest: No conflict of interest.

ABSTRACT

Psoriasis is a chronic, multisystem inflammatory disease with predominantly skin and joint involvement. It is a long standing autoimmune disease characterized by patches of abnormal skin. It is non-infectious chronic inflammatory disease of skin characterized by well-defined erythmatous plaques with silvery scale. Psoraisis varies in severity from small localized patches to complete body coverage. The disease not only affects the patient physically but also disturbs the mental and social health of the patient. There is no satisfactory treatment available for Psoriasis. Ayurvedic treatment can give promosing results in such patients. In Ayurveda all skin diseases are described under the umbrella of *Kushtha* and in that Psoriasis is categorised under *Ek-Kushtha*. Repeated Shodhan Chikitsa followed by various Shaman Yogas and Rasayan Chikitsa for continued remission are emphasized in treatment of Kushtha in all ancient Ayurvedic texts. In this article a case of psoriasis is being presented which was treated successfully with Ayurvedic management.

KEYWORDS: Psoriasis, Ekakushtha, Virechana, Shodhan Chikitsa, Shamana Chikitsa, Rasayana chikitsa.

INTRODUCTION

Psoriasis is papulosquamous disease i.e. papules or plaques are covered with scales. Psoriasis is non-infectious chronic inflammatory disease of skin characterized by well-defined erythmatous plaques with silvery scale. Exact etiology is unknown, though the current thinking is that psoriasis is one of the commonest autoimmune diseases occurring in human. Familial occurrence suggests genetic predisposition. Mechanical, chemical or radiation

trauma can initiate or worsen psoriasis. Drugs like chloroquine, beta blockers & NSAIDs can worsen or induce psoriasis. Withdrawal of systemic corticosteroids in a patient with of psoriasis can precipitate an attack of erythrodermic or generalized pustular psoriasis. Summer improves psoriasis and winter worsens it. According to W.H.O. the world-wide prevalence of Psoriasis is 1-2%. It is spreading fast because of unsuitable life-style changes such as dietary pattern, busy schedule and stress. There is no satisfactory treatment available for Psoriasis. Pathology seen in psoriasis is that there is accelerated epidermal turnover and deficient keratinocyte maturation results in visible exfoliation of skin. Vascular changes lead to erythema whereas dense neutrophilic infiltrate may lead to formation of pustules. Initial lesion of psoriasis is a barely elevated erythematous papule topped by a whitish scale. Sometimes scales may not be evident unless the surface is stroked or scratched. Papules may enlarge or coalesce to form plaques covered with thick silvery scales. When the scales are removed, pinpoint bleeding is visible on the involved skin (Auspitz sign).Thus fully established psoriasis consists of well-defined rounded erythematous plaques covered with thick silvery scales. There may be variation in distribution such as scalp psoriaisis, palmoplantar psoriasis, nail psoriasis.[1]

In Ayurveda majority of all skin diseases are described under the chapter of Kushtha in Charak Samhita chikitsa sthaan. Vitiated doshas destroys the skin structure creating discolouration of skin. Kustha are divided into 2 types, (a) Mahakustha, (b) Kshudra Kustha. Mahakustha is again divided into 7 types and Kshudra Kustha is divided into 11 types.[2]

Commonly described etiological factors for development of Kustha are Viruddha Annapana, Drava Snigdha Guru Bhojan, Vegvidharana, eating during Ajeerna Avastha, Mitthyopacharin Panchakarma procedures etc.because of all these etiological factors all three doshas get vitiated and cause vitiation of twak (skin), Rakta (blood), mamsa dhatu (Muscular tissue) & Lasika (serum/lymph).[3] Symptoms of psoriasis can be correlated well with the symptoms of ekakustha and kitibh.[4]

Ekakushtha is described as Vata-Kapha predominant disease having signs and symptoms as - Aswedanam (absence of sweating), Mahavastu (big size lesions) and Matsyashakalopamam (scaling). Symptoms of Kitibha are skin discolouration (Shyava Varna - blackish discolouration), Khara Sparsha(keratinized skin).[5]

CASE REPORT

A 56-years male patient presented in Aarihant Ayurvedic Medical, Hospital, Panchkarma OPD with complaints of erythematous plaques over both legs. It was associated with scaling. Auspitz sign was positive. He was not having any past history of major medical and surgical illness. Patient was taking allopathic treatment for the psoriasis but, did not get much relief. So patient approached for Ayurved treatment.

MATERIALS AND METHODS

Assessment Criteria.

Aswedanam (Absence of Sweating)

Normal Sweating	0
Mild Sweating	1
Mild Sweating on exercise/exertion	2
No Sweating after exercise/exertion	3

Mahavastu (Big size lesion)

No lesion	0
Lesion on partial part of body (Hands and feet)	1
Lesion on most part of body (Abdomen and back area of body)	2
Lesion on almost whole part of body	3

Matsyashakalopamam (Scaling)

No scaling	0
Mild scaling from all lesions	1
Moderate scaling from all lesions	2
Severe scaling from all lesions	3

Skin Discouration (Shyav Varnata)

No discoloration	0
Discolouration on partial part of body.	1
Discolouration on most part of body.	2
Discolouration on whole part of body.	3

Treatment given

Dipana Pachana Chikitsa followed by Shodhana and then Shamana Chikitsa.

1.Deepana Chikitsa - Hingwasthak Churna 5gms 2 times a day before meal with ghrit anupan for 3 days.

2.Pachana Chikitsa- Musta (Cyperus rotundus) and Shunthi (Zingiber officinale) Kwatha (Decoction as mentioned in mentioned in Sharangdhar Samhita) given 20ml BID after meal for 3days.

Chitrakadi Vati 250mg 2 tabs 3 times a day with lukewarm water was given during Deepana Pachana Chikitsa.

3.Snehapan with Tiktaka Ghrita given in morning at 7:00 am for 7 days with increasing quantity of Ghrita every day, Anupana - Koshna Jala (Luke warm water).

a) 1st Day - 30ml Ghrita.
b) 2nd Day - 60ml Ghrita.
c) 3rd Day - 90ml Ghrita.
d) 4th Day - 120ml Ghrita.
e) 5th Day - 150ml Ghrita.
f) 6th Day - 180ml Ghrita.
g) 7th Day - 210ml Ghrita.

Sneha Siddhi Lakshan were continuosly monitored. Patient was asked to stop snehapaan after 7 days as Sneha Sansiddhi Lakshan were observed.

1. Then for 2 days Sarvang Snehan, Sarvang Swedana was given - Snehana with til oil, Swedana with Dashmool Bharad kwath.

2. On Third day after Snehapana - Virechana was given: Kalpa prepared for Virechan – Cows milk 60 ml plus Abhayadi Modak 4 tablets were given. This preparation was given orally to patient at 9:30 am in the morning after Snehana and Swedana. After one and half hour Virechana Vega (Loose Motion) was started. Ten Virechana Vega (Loose Motion passed) in 12 hours. Pulse Rate and Blood Pressure after Virechana were within normal limit. Sansarjana Krama (rules about diet after Shodhana Chikitsa) advised for 5 days.

3. Shamana Yoga was started 5 days after Virechana. Treatment given Kaishora Guggulu, Gandhaka Rasayana, Mahamanjishthadi Kwath[6] 30ml 2 times a day. Jatyadi taila was advised for local application.

BEFORE TREATMENT

AFTER TREATMENT

DISCUSSION

In above case study patient got satisfactory relief from symptoms of psoriasis. Ayurveda has Panchakarma Chikitsa as its unique specialty. In this case study Virechana Chikitsa showed good results along with Shamana Yoga. In Kustha Chikitsa according to Acharya repeated Shodhan Chikitsa should be given to Kustha patient. According to text Virechan should be given every month. Virechana Chikitsa is indicated for vitiated pitta and Kapha Dosha. In this case patient was having symptoms of Tridosha vitiation with predominance of Vata and Kapha Dosha. Virechan Chikitsa helps to remove vitiated Dosha from body. Shaman Yoga was given as a combination of Kaishor Guggul 500 mg bid, Gandhak Rasayan 250 mg bid and Mahamanjishthadi Kwatha 20 ml along with local application of Jatyadi taila.

Rasayana Chikitsa was also given with Tiktaka Ghrita10ml orally on empty stomach. Main content of Kaishora Guggulu is Guduchi, Triphala, Trikatu, Vidanga, Pippali, Chitraka, Dantimool and Nishothaalong with Guggulu. This Kalpais useful for vitiated Kapha Dosha & Rakta Dushti. Guduchi is *Agrya* medicine for vitiated Vata Kapha Rakta. And other content

like Vidang, Trikatu, Danti Pippali, Chitraka are very good medicine for Vata Kapha. They reduce excessively accumulated Kleda at the affected region. Gandhak Rasayana is drug of choice for the vitiated for Pitta Dosha, this combination of Kaishor Guggulu and Gandhak Rasayana found to very much useful in this case of psoriaisis. These 2 medicines were given with Anupana as Mahamanjishthadi kwath. Contents of Mahamanjishthadi kwath[6] are Ananthamoola, Daruharidra, Devdaru, Haritaki, Kantakari, Manjishtha, Vacha, Baheda, Chirata and Nimba. This Kwatha has Kledaghna, Kaphaghna and Rakta Shodhan property. Patient was adviced for local application of Jatyadi taila twice a day at affected part. This local application act by Shodhanaand Ropan Chikitsa. Rasayana Chikitsa was given with Tiktak Ghrita orally. It acts to pacify Vata and Kapha Dosha. It also provides internal oleation which is important part of the psoriasis treatment.

CONCLUSION

In this case study marked improvement was seen in patient of psoriasis. The treatment so planned was helpful in Aampachan, removal of vitiated Dosha from body and bringing Samyavastha (balanced condition) of Doshas. Also it improved Vyadhikshamatwa of patient and hence the treatment was effective to relieve the symptoms and induce remission.

ABSTRACT

Introduction: The Science involves knowledge which follows some fundamental laws. There are many types of it among them physical science, the earth sciences, biological sciences etc. *Ayurveda* is life science which deals with body, mind and social wellbeing. **Aims and Objectives:** The aim of the present study is to understand and explore the significance of Science and Technology in Traditional Medicine with special reference to *Trisutra Ayurveda*. They are *Hetu, Linga and Aushadha*. **Materials and Methods:** This is a review article based on explanation and interpretation of references collected from the classic Ayurvedic texts, various research articles and websites. **Discussion:** Applying science in traditional medicine we can achieve the highest goal of the health care system by pinpoint diagnosis of many diseases, proper treatment protocols and therapies, use of advance instruments etc. for *Hetu (*causative factor) we can use microscopes, to understand *Linga* (sign and symptoms of a disease) *we* can take advantage of *Nadi Yantra*, Tongue Device and for *Aushadha (Ayurvedic Medicines)* we can make changes in the tablets form, shelf life, using science technology we can develop advanced panchakarma instruments ex. Automatic *shirodhara yantra*. **Conclusion:** Hence Science with traditional medicine w.s.r. to *Ayurveda* together play an important role to keep mankind not only disease free but it adds a heathy active lifestyle.

Key Words: Science, Traditional Medicine, *Ayurveda, Hetu, Linga, Aushadha*

INTRODUCTION: Science is such a double-edged sword that if used properly, it will create, but if it is used due to some misconception, then sure to be destroyed. In the present article, we will understand the usefulness of science and our traditional medicine. With the help of science, we can understand more about our traditional medicine and we will also know what science is hidden inside our traditional medicines, which is the definite need of the hour. Today, when the crisis situation that has arisen around the world, we try to overcome it to some extent through our traditional medicine.

AIM AND OBJECTIVE: The aim of the present study is to understand and explore the significance of *Science and Technology* in *Traditional Medicine* with special reference to *Trisutra Ayurveda*. By adapting scientific approach, we can find out causative agent for any disease accurately, we recognize pinpoint sign and symptoms of particular disease with the help of various medical gadgets, and accordingly we can prescribe the medicine to the patient with various forms like tablets, syrups, Capsule etc.

MATERIALS AND METHODS:

This is a review article based on explanation and interpretation of references collected from the classic *Ayurvedic* texts including *Charaka Samhita*, *Sushruta Samhita*, *Ashtang*

Hridaya and *Ashtang Sangraha and* other standard textbooks along with research articles and various websites on Science, Traditional Medicines, *Trisutra Ayurveda* that is *Hetu* (causes or etiology), *Linga* (Sign and symptoms), and *Aushadha* (Ayurvedic Medicine or therapies).

Review of Literature: Science and Traditional Medicine Science:

When we talk about science, first of all we will understand the definition of science by World Health Organization.

"Science is defined as any system of knowledge that is concerned with the physical world and its phenomena and that entails unbiased observations and systematic experimentation."[1]

Now we will discuss about some types of science here, it is divided in many types as,

1. The physical sciences study the inorganic world and comprise the fields of astronomy, physics, chemistry.
2. The Earth sciences.
3. The biological sciences such as biology and medicine study the organic world of life and its processes.
4. The social sciences like anthropology study the social and cultural aspects of human behaviour.

Traditional Medicine: The definition of traditional medicine by the 'World Health Organization' is defined as "the sum total of the knowledge, skills, Practices which is based on the theories, beliefs, and experiences[2] to cure of body as well as and mind."

India is well known for its six traditional medicinal systems that is *Ayurveda, Siddha, Unani, Yoga, Naturopathy, Homoeopathy*.[3] India is consecrated with an ancient heritage of traditional Indian medicine and *Ayurveda* is the most popular traditional systems among all.

Health: According to WHO health is defined as "Health is a state of complete physical, mental, and social well-being and not merely the absence of disease or infirmity."[4] *Ayurveda* consider health as equality of body, mind, and spirit. According to *Acharya Sushruta* health of the person is mentioned as, "The person is called as healthy *(swastha)*, if he has balanced or equilibrium condition of *dosha* (bio-energies), *dhatu* (body tissues), *mala* (waste products), *agni* (digestive fire) and happy and balanced state of soul, sense organs and mind.[5]

Illness: An unwell feeling of body and mind can be consider as Illness, according to *Ayurveda*, the root cause of any disease is always the imbalance of *Tridoshas* (body humours), which further manifests as imbalance in other body components inevitably leading to disease.[6]

The basic aim of any healthcare in the world is to restore those who are ill to health. Health and illness have always been a prime concern of human beings. In India, two parallel medical systems (i.e., Modern and Traditional) exist side by side. Modern medicine is evidence-based and traditional medicine which is present in our culture with evidence.

Ayurveda: The word *Ayurveda* is derived from two Sanskrit words, *'Ayu'* which means life and *'Veda'* which means science or knowledge. Hence the meaning of the word *Ayurveda* is the science of life.[7] *Ayurveda* takes into consideration physical, psychological, philosophical, ethical, and spiritual wellbeing of people.

Scientific Interpretation of *Trisutra*:

Ayurveda has three main components of treatment in order to treat various patients or diseases. The three parts of *Ayurveda* are collectively known as *Trisutra. Hetu* (causes or etiology), *Linga* (Sign and

symptoms), *Aushadh* (Ayurvedic Medicine or therapies). [8]

Now we will discuss in details about *Trisutras* which are present in *Samhitas,*

1. *Hetu* – Identification and Isolation of causative factors of a disease. Generally, *Hetu* can be categorized by two headings as a 1. *Bahya Hetu:* Various unwholesome diets, ill effects of seasons etc 2. *Abhyantara Hetu***:** Internal factors of the disease such as *Dosha Dushya* involved, Microorganism (*Sukshama krimi)* etc.

2. *Linga* – knowing a disease in its entirely by identifying its signs and symptoms (diagnosis). *Ayurveda* has eight ways to diagnose illness: *Nadi* (pulse), *Mootra* (urine), *Mala* (stool), *Jihva* (tongue), *Shabda* (speech), *Sparsha* (touch), *Druk* (vision), and *Aakruti* (appearance)[9].

3. *Aushadha* – treating disease comprehensively after properly diagnosing it i.e., giving *Ayurvedic* medicine or therapies. There are many treatment protocols mentioned in *Ayurvedic Samhitas*, we can choose or select particular treatment plan according to the *Prakriti* and *Dosha Lakshanas* present in the persons, some of the common treatment protocols is as below:

*Nidana Parivarjana (*Removal of Causes*)*[10], *Pathya Sevana* (Eating substances which help body and mind in curing of disease)[11], *Santarpana* (overnutrition), *or Apatarpana* (undernutrition)[12], *Shamana* (Palliative treatments) *or Shodhana* (Detoxifying / Purificatory procedures), *Daiva Vyapashraya* (Mystic & Spiritual healing), *Yukti Vyapashraya* (Intelligent use of drugs)[13,] *Rasayana* (rejuvenation) *and Vajikarana* (Sexual Rejuvenation Therapy)[14] *and Satvavajaya Chikitsa* (Ayurvedic psychotherapy)[15,] *Antah Parimarjana* (Internal cleanse or purify or heal), *Bahi Parimarjana* (outside cleanse or purify or heal*),*[16] *and Shashtra Pranidhana* (surgical treatments) etc.

Science in Ayurveda: After expression of the *Trisutra* of Ayurveda now we will throw some light on what are the scientific things present in *Ayurvedic* text which is the eyeopener of today's world. It is found that many of the *Ayurvedic* drugs, formulations, therapies have evidence-based results. When we talk about drug how can we forgot the importance of turmeric[17], its medicinal properties, and health benefits. *Amla* is such drug which is the best source of vitamin C and is useful in improve Immunity is proven. *Ayurvedic* therapies like *Shirodhara*[18] has significance outcome with Neurological benefits, Stress relieving effects, another most important example is *Jaluka*[19] - the leech therapy, useful in Varicose veins provide effective relief to patients, Preparation and use of *Kshara Sutra*[20]*:* Medicated thread tying technique for treatment of anal fistula has been accepted by surgeons.

DISCUSSION: Utilization of correct modern scientific techniques can give us better *Ayurvedic* drug preparation and form, using technology we can improve *Panchakarma* therapy instruments for beneficial of mankind. We can achieve our highest health goals with scientific approach in *Hetu, Linga and Aushadha.*

To know the *Hetu* of various diseases we can use the Microscope for Microbiology and Parasitology to identify different types of bacteria and parasites. For Unkind seasons which can affect heath on great extent we take consideration of weather forecasting and according to that make our lifestyle.

To understand exact sign and symptoms of a disease that is *Linga*, we

can use following instruments or procedures which are equipped with the help of science and technology for example for *Ayurvedic Pulse* diagnosis we can use *Nadi Yantra*[21], For Urine examinations we can do its Physical as well as chemical analysis, for *Jivha* examinations we can use tongue device which can give us exact color, texture and buds information and so many instruments and devices can be build up to do the diagnosis.

Aushadha which is the third pillar of *Trisutra Ayurveda* can be divided in to two basic types i.e.*Shamana* (Drug treatment) and *Shodhana (Panchakarma Treatment*). *Ayurvedic* medicines can be convert in advanced form so as it becomes more feasible to the patient. Using modern scientific approach *Vati* (Tablets) should be well coated, its shelf life can be increased with specific organic agents. Specific *Ayurvedic* therapies like *Panchakarma* we can use *Auto Electric Shirodhara Yantra*[22], *Calibrated Basti Yantra for Basti* (Medicated Enema), Various *Local Basti Yantras.*

CONCLUSION: The main aim of Science and Technology is to make things simple and easy to practice. In healthcare system symphony of Science and Traditional Medicine can progresses the overall standards and quality of life, as well as extension of life. To meet *Ayurveda's* goal of health, that is curative as well as preventive for illness can be achieved with scientific modification in *Trisutra Ayurveda*. It helps in pinpoint the diagnosis and treatment of diseases. Personalized treatment protocols can be introduced and assess with the help of technology. We can manage side effects of some modern medicines which are used for long time in chronic disease like Rheumatoid Arthritis, Chronic Skin Diseases, Cancer etc. It educates researchers, doctors, scientists, and even laypersons on how to live a healthy active life.

ABSTRACT

Haritakyadi Gutika is an important ayurvedic polyherbal formulation. It should be used in kasa (chronic cough), and shwasa (asthma). **Aim:** The objective was to exploit the standard manufacturing procedure (SMP) and quality standards of Haritakyadi Gutika. **Materials and Methods:** In this present study, Haritakyadi Gutika was prepared in three batches to produce SMP. **Results:** Ingredients of Haritakyadi Gutika in which average percentage yield of Haritaki Churna was 94.26%, Nagar Churna was 94.41%, Musta Churna 94.14 % and Guda Paka was 99.20%; Averagely 91% *Haritakyadi Gutika* was obtained from total ingredients. **Conclusion:** Pharmaceutical Standardization made re-genesis of drug and production of secure potent drugs and useful in scientific area of research in future.

KEYWORDS: *Haritakyadi Gutika*, *Churna* preparation, Standardization.

INTRODUCTION

Haritakyadi Gutika is an important formulation in Ayurveda under the category of Polyherbal Medicine mentioned in *Kasa* (Cough) *Chikitsa Prakarana* of *Chakradatta* 11th *Adhyaya.*[1]

Triumph by Ayurvedic Medicine was totally dependent on the quality of medicine prescribed to patient. In *Chatushpad*, All treatise of Ayurveda given importance to *Vaidya.*[2] An ancient time, *vaidya* used traditional method of preparation of medicine according to diseases. The herbal medication of Ayurved retrieve the Siddhant of ***'Sarvam Dravyam Panchbhautikam Asmin Arthe'.***[3] These *Haritakyadi Gutika* medicine was prepared by the method given in *Sharangdhar Samhita.*[4] The ingredients present in the *Haritakyadi Gutika* are *Haritaki churna (Terminalia chebula), Nagarchurna (Zingiber officinale), Musta churna (Cyperus rotundus), Guda (Saccharum officinarum).* As this yoga was indicated in *Kasa* (Chronic cough) *Chikitsa, Purana* (Old) *Guda* (Jaggery) was preferably used for present study. This *Gutika* also used in the treatment of *Shwasa* (Chronic asthma). The specific pharmaceutical homogenous mixture of these contents can result in a more significant formulation. Therefore the present study has been planned to standardize the method of preparation of *Haritakyadi Gutika* according to method explained in classical texts. *Vatak, Gutika, Vati, Modaka, Vatika, Pindi, Guda* and *Varti* are the synonyms of *vati.*[5] All these terminologies are used as synonyms for *vati* in different part of classics. *Gutika* is a rounded shaped pill being purposefully used for internal administration.

MATERIAL AND METHODS

Collection of raw materials.

Sr. No.	Raw Material	Latin Name	Part Used
1	*Haritaki*	*Terminalia chebula*	Fruit
2	*Nagar*	*Zingiber officinale*	Rhizome
3	*Musta*	*Cyperus rotundus*	Root
4	*Guda(Jaggery)*	*Saccharum officinarum*	-

Haritaki, Nagar, Musta and *Guda*were obtained from the local market of yeola, Dist. Nashik. Preparation of *Haritakyadi Gutika* with the reference of *Sharangadhar Samhita*, was carried out in the Department of Rasashastra & Bhaishajyakalpana, Matoshri Asarabai Darade Ayurved College, Babhulgaon, Tal-Yeola, Dist.-Nashik, Maharashtra.

Equipment Used

Khalwa (Stone Khalwayantra, Length 12 inch), Stainless steel container 3 litre capacity, Stainless steel tray (length – 24 inch, width – 24 inch), Ladle stainless steel length: 15 cm, Cloth: clean cotton cloth of 1 × 1 feet, measuring machine: 2 kg capacity, and gas burner with LPG cylinder (14.5 kg capacity) were used in making process of Gutika.

Pharmaceutical Preparation of *Haritakyadi Gutika*

Study was carried out in three stages

1) **Stage I** -*Haritaki*, *Nagar*, *Musta Churna* preparation.
2) **Stage II** - Liquefaction of *Guda* (Jaggery) as per symptoms of *Guda paka.*
3) **Stage III** - Preparation of homogenous mixture of all ingredients and making of *Haritakyadi Gutika*

Stage I

***Haritaki Churna* Preparation**

Ingredients :- Dry *Haritaki* Fruit - 100 g

Procedure :-Dried *Haritaki* checked for any external impurities then it taken and triturated into clean *khalwa yantra* and filtered through clean white cotton cloth to obtain very fine powder.[6]

Observation :-Brownish coloured *Haritaki Churna* was obtained.

***Nagar Churna* Preparation**

Ingredients :-Dry *Nagar* (Ginger) Rhizome 100 g.

Procedure :-Dried *Nagar* checked for any external impurities then it taken and triturated into clean *khalwa yantra* and filtered through clean white cotton cloth to obtain very fine powder.

Observation :-White or Slightly Brownish coloured *nagar* churna was obtained.

***Musta Churna* Preparation**

Ingredients:- Dry *Musta* root 100 g.

Procedure:- Dried *Musta* root checked for any external impurities then it taken and triturated into clean *khalwa yantra* and filtered through clean white cotton cloth to obtain very fine powder.

Observation:- Brownish coloured *musta* churna was obtained.

Stage 2 - Preparation of *Guda Paka*

After removal of external impurities, clean raw *Guda* should be taken in equal quantity of *churna* (about 300 g) into clean wide mouthed stainless steel vessel of 3 liter sizes. It is added with required 5 ml quantity of water, placed over mild fire and heated with frequent stirring.

Stage 3 -Preparation of homogenous mixture of all ingredients and making of *Haritakyadi Gutika*.

Preparation of homogenous mixture of all ingredients

When *Gudapaka* of suitable consistency was obtained then removed from fire and the fine powder of *haritaki*, *nagar*, *musta* was added one by one into the vessel containing *Guda paka*. Homogeneous mixture of all ingredients was formed.

Making of *Haritakyadi Gutika*

After Homogeneous mixture of all ingredients it left for self-cooling. After cooling of mixture, *Gutika* (Pills) were made by hand with equal shape, size and weight. The prepared *Haritakyadi Gutika* were later dried in shade and stored in airtight container.[7]

RESULT

Table No 1: Showing the result of *Haritaki Churna* Preparation.

Batch	Initial weight of raw *Haritaki* (g) (before cleaning)	Initial weight of raw *Haritaki* (g) (after cleaning)	Weight of obtained *Haritaki* churna (g)	Weight loss(g)	Yield (%)
I	100	98	93	5	94.89
II	100	96.5	91	5.5	94.30
III	100	94	88	6	93.61
Average	100	96	91	5.5	94.26

Table No 2: Showing the result of *Nagar Churna* Preparation.

Batch	Initial weight of raw *Nagar* (g) (before cleaning)	Initial weight of raw *Nagar*(g) (after cleaning)	Weight of obtained *Nagar* churna (g)	Weight loss(g)	Yield (%)
I	100	96	90	6	93.75
II	100	94	88.5	5.5	94.14
III	100	97	92.5	4.5	95.36
Average	100	96	90	5	94.41

Table No 3: Showing the result of *Musta Churna* Preparation.

Batch	Initial weight of raw *Musta* (g) (before cleaning)	Initial weight of raw *Musta* (g) (after cleaning)	Weight of obtained *Musta* churna (g)	Weight loss(g)	Yield (%)
I	100	94	89	5	94.68
II	100	92	86	6	93.47
III	100	96	90.5	5.5	94.27
Average	100	94	89	5.5	94.14

Table No 4: Showing the result of *Gudapaka*Preparation.

Batch	Initial weight of raw *Guda* (g) (before cleaning)	Initial weight of raw *Guda* (g) (after cleaning)	Quantity of water (ml)	Weight of obtained *Guda Paka* (g)	Weight loss (g)	Yield (%)
I	300	294	05	292	2	99.31
II	300	296	05	293	3	98.98
III	300	295	05	293	2	99.32
Average	300	295	05	293	2	99.20

Table No 5: Showing the result of mixing of component drugs of *Haritakyadi Gutika.*

Batch	Initial weight of *Haritakyadi Gutika* before drying (g)	Final weight of *Haritakyadi Gutika* after drying (g)	Weight loss (g)	Total percentage of *Haritakyadi Gutika* obtained
I	564	549	15	91.5
II	558.5	540	18.5	90
III	564	545	19	91
Average	562	549	17.5	91

DISCUSSION

As per classical texts of *Chakradatta, Haritaki, Nagar, Musta* equal amount of fine powder mixed with equal quantity of *guda* (jaggery) & prepared *Gutika* used in *kasa* (chronic cough) and *shwasa* (asthma) diseases.[8]

Properties of *haritaki* are light to digest, *ruksha* qualities, Astringent dominance five rasa (except *lavana* rasa), sweet after digestion (*vipak*) with hot potency[9] and properties of *nagar* are light to digest, *snigdha* qualities, pungent in taste, sweet after digestion (*vipak*) with hot potency[10] while properties of *mustak* are light to digest, ruksha qualities, bitter, pungent, astringent in taste, pungent after digestion (*vipak*) with cold potency.[11] Old /stored jaggery is light to digest (*laghu*), forms wholesome diet, doesn't block the channels, enhances digestive capacity, pacifies *pitta and vata*, sweet taste (*rasa*), aphrodisiac and vitalizes *Rakta* (i.e. improves haemoglobin).[12]

The pharmaceutical procedures used in this study are *churna* preparation, *guda paka* preparation, *gutika* preparation. Dry *haritaki, nagar, musta* dravyas were made into very fine powder as per reference of *Sharangdhar Samhita*.

In stainless steel vessel, *Gudapaka* made by the references present in *Sharangdhar Samhita* and fine powder of *Haritaki, Nagar, Musta* were mixed to this *Guda Paka* and homogeneous mixture was formed. After that *Gutika* were prepared later dried in shade & stored in airtight container.

Initially after preparation of *Haritakyadi Gutika* weight were found as per batch 564 g, 558.5 g, 564 g, average 562 g; then this *gutika* dried in shade again and measured weight again as per batch were found that 549 g, 540 g, 545 g& average 549 g weight. In total 3 batches of *Haritakyadi Gutika*, Batch I prepared 91.5% *gutika* from total components of drugs while batch II prepared 90% *gutika* and batch III prepared 91% *gutika* from given component.

CONCLUSION

Averagely 91% *Haritakyadi Gutika* was obtained from total ingredients and average 9% loss was found due to removal of external impurities, sticking to the vessel and moisture.

Pharmaceutical Standardization being an initial step towards standardization of any drug. So, it should be done with extreme precision. This leads to re-genesis of drug and production of secure potent drugs. It will be help to scientific researcher in future.

Elaboration of *Visha* in rasa classics with special reference to *Rasamanjiri*

1. **Dr. Sameeksha Gurav** MD(Ayu), PhD Scholar, Professor & HOD, Aarihant Ayurvedic Medical College & Research Institute, Gandhinagar, Gujarat, 382421.
2. **Dr. Santosh Gurav** MD(Ayu), PhD Scholar, Professor & HOD, Aarihant Ayurvedic Medical College & Research Institute, Gandhinagar, Gujarat, 382421.

Abstract

Ayurveda is a science of antiquity, still in the practice of unbroken continuity. It represents the totality of life and gives complete knowledge required to maintain the holistic balance of the functioning of mind and body.

Rasamanjari was originally written in Sanskrit. 75 years back it was translated to Hindi by Sri Krishnanath of Mathura and published at Lakshmi Venkateshwara press Mumbai by its owner Sri Ganga Vishnu Srikrishnadas Ji Acharya. Later, as a part of the rewriting of rare books, Chaukhamba Orientalia took this book, and Acharya Siddhi Nandan Mishra compiled and published it in 1995.

Visha plays a great role in the treatment and is described as nectar in certain classical texts. Acharya Charaka has also mentioned that if poison is taken in appropriate quantity and form then it can act as medicine, if the medicine is taken inappropriately it acts as a poison. Hence there is a need to understand about poisons in detail from various classical texts.

Identification of poisons along with their special characteristics has been described in detail in this book which is not found elsewhere. The method of reduction of potency or *tikshnatwa* of poisons is mentioned in the book along with the *shodhana* method. *Visha* is described in detail in *Rasamanjari*. The author has dedicated the complete chapter for the description of *Visha*. This article attempts to highlight the peculiarities related to poisons that are not mentioned in other texts. It will also help future scholars and pharmaceutical companies to use methods described in this book while formulating drugs with *Visha* as an ingredient.

Keywords – *Rasamanjiri, Visha, Visha matra, Visha tikshnatwa, Visha* identification.

Introduction

Ayurveda is a science of antiquity, still in the practice of unbroken continuity. It represents the totality of life and gives complete knowledge required to maintain the holistic balance of the functioning of mind and body.

The richness of Ayurvedic therapy is with the drugs of natural resources, lack of side effects, wide compatibility, elimination of vitiating body humor, and maintenance of normal metabolic activities, in addition to curative and preventive aspects. *Rasa sastra* is one of the chief branches of *Ayurveda* with a wide range of potent formulations and rich literary treasures. *Rasamanjiri* is one among them, which was written sometime in the medieval Indian era.

The author of this book has given his brief introduction as the son of Sri Vidyanath. He has not given any information regarding his caste or the place to which he belongs. But, modern scholars of *Rasa sastra* consider his time period to be the 15th century.

Although we cannot find Shalinath's name among the names of 29 *Siddhas*, but he can be considered as one of the *Siddhas* from *Nath sampradaya*, because of his suffix Nath, which is a common tradition among the followers of the *Nath* cult. A *Nath sampradaya* is an initiatory *Guru Shishya* tradition. The primary aim of *Natha Siddhas* is to achieve liberation *(jeevanmukti*) during the current life span. The author of this book has also given priority to this method of learning. It is also an established practice in *Naths* to deal with tradition. Indian alchemy practices, extensively use cinnabar, mercury, crystal preparations, and other minerals for ritual, spiritual and medicinal usage. As a follower of *Nath sampradaya*, the author also described them in this book.

Rasamanjiri was originally written in Sanskrit. 75 years back it was translated to Hindi by Sri Krishnanath of Mathura and published at Lakshmi Venkateshwara press Mumbai by its owner Sri Ganga Vishnu Srikrishnadas Ji Acharya. Later, as a part of the rewriting of rare books, Chaukhamba Orientalia took this book, and Acharya Siddhi Nandan Mishra compiled and published it in 1995. This book was reprinted in 2010.

Visha plays a great role in the treatment and is described as nectar in certain classical texts. Acharya Charaka has also mentioned that if poison is taken in appropriate quantity and form then it can act as medicine, if the medicine is taken inappropriately it acts as a poison. (1) Hence there is a need to understand poisons in detail from various classical texts.

Rasa tarangini has described poison as *Sthavar* and *Jangam*. *Sthavar Visha* is again classified into *MahaVisha* and *UpaVisha*. But here no description of the appearance of each *Visha* is not provided which is provided in *Rasamanjiri*. *Rasamanjiri* has described in detail about poisons, their types, appearance, reducing their *tikshnatwa*, dose to be administered, *shodhana*, *ritu* for sevana of *Visha*, *mantra chikitsa*, *Visha*ghna yoga, and *pathya apathya* during intake of pure *Visha* is also described in detail.

Names of *Visha*s

The author has laid emphasis on *Visha* in this book and described them in detail. Eighteen types of kanda *Visha* are described in detail namely,

1. *Kalakuta Visha*, 2. *Mayurakhya Visha, 3. Binduka Visha, 4. Saktuka Visha,*

5. *Valuka Visha, 6. Vatsanabh Visha, 7. Shankhnabh Visha, 8. Sumangal Visha,*

9. Shringi Visha, 10. Markat Visha, 11. Musta Visha, 12. Kardam Visha,

13. Pushkar Visha, 14. Shikhi Visha, 15. Haridra Visha, 16. Harit Visha,

17. Chakra Visha, and 18. Halahal Visha.(2)

Appearance of *Visha*s (3)

Table no.1: Appearance of *Visha*s

Sr.No.	Names of poisons	Appearance
1.	k*alkuta Visha*	thick, dry, hard, and black like (*Anjana*) collyrium
2.	*MayurVisha*	looks like a peacock
3.	*Binduk Visha*	it looks like drop (*bindu)*
4.	*shaktuka*	looks like *shaktu and kamalkanda*
5.	*valuka Visha*	It has sand like grains in tuber *(kanda).*
6.	*Vatsanabh Visha*	*pandu varna* in appearance
7.	*Shankhnabh Visha*	looks like *shankha*
8.	*Sumangal Visha*	white in color
9.	*Shringi Visha*	is heavy, thick, black, and *shringa aakaar* in shape.
10.	*Markat Visha*	color of monkey.
11.	*KardamVisha*	white and yellow and like mud in color.
12.	*PushkarVisha*	the color of blue lotus.
13.	*ShikhiVisha*	color of a peacock's crown.
14.	*Haridra Visha*	yellow in color and has a tuber.
15.	*Harita Visha*	green in color.

16.	*Chakra Visha*	tuber has circular rings.
17.	*Halahal Visha*	blue in color

Types of *Visha(4)*

There are four types of *Visha* and each type of kanda *Visha* is classified into these four types. Namely,

a. *Brahman*
b. *Kshatriya*
c. *Vaishya*
d. *Shudra*

Brahman Visha is white in color. *Kshatriya Visha* is red in color, *Vaishya Visha* is yellow in color and *kshudra Visha* is black in color. *Kshudra Visha* is the least in qualities as compared to other *Visha*s.

Brahman Visha is used to cure diseases. If anyone has consumed poison then he must be given *kshatriya Visha*. *Vaishya Visha* can be given in all diseases. *Kshudra Visha* is to be used in snake bite poisoning.

Reduction in the potency of *Visha(5)*

The author has said in shloka that *Visha* becomes mrita after t*ritu*ration with an equal quantity of purified *tankan.* The potency of poisons can be reduced by this procedure. Poison mixed with *Tankan* should be used for all diseases. *Kanda Visha* mixed with *tankan* does not cause any ill effects on the body.

Purification of *kandaVisha* (poison)(6)

Poison (*kandaVisha*) should be cut into small pieces and kept in a pot filled with *gomutra*. The pot should then be kept in bright sunlight. On the second day, *gomutra* is changed and the pot is again kept in the Sun. On the third day again *gomutra* is changed and the pot is kept on fire and boiled for 2-3 hours. Then *kanda Visha* is then dried, powdered, and filled in the bottle for further use.

Dose of pure *Visha*(7)

Pure *Visha* should be taken in quantity of one *sarshapa* on the first day, two *sarshapa* on day two, three *sarshapa* on day three, four *sarshapa* on day four, five *sarshapa* on day five, six *sarshapa* on day six and seven *sarshapa* on day seven. Then the quantity is reduced from 8 to 14 days daily reducing 1-1 *sarshapa*. On day 14 the quantity of *Visha* must be one *sarshapa*. In the third week, poison should be administered in the quantity of one *yava* in increasing order increasing one *yava* each day. From the fourth week quantity of poison should be decreased by one *yava* each day up to the 28^{th} day. On the 28^{th} day the quantity of *Visha* is one *yava*. A healthy person can take one *yava* of poison daily. The person suffering from leprosy *(kushtha*) should consume one *ratti* of *Visha* every day.

Favorable season for the administration of *visha (Visha sevan kala*)(8)

Purified poison can be consumed in *Sharad ritu, Grishma ritu, Vasant ritu and Varsha ritu*. If pure poison is consumed for four months, it alleviates leprosy (*kushtha*) and *luta Visha (*spider poison*).*

Contra-indication for the administration of *visha (Visha prayoga nishedh*)(9)

A person less than 8 years of age and over 80 years of age should not consume pure poison. If any *Vaidya* uses poison in a person above 80 and less than 8 years then it produces dangerous side effects.

***Pathyas* during poison consumption (10)**

Pure *Visha* should be used in all diseases with the *anupana* of *goghrita* or *godugdha*. Its use produces rejuvenating effects on the body.

The person consuming pure *Visha* should follow celibacy. If he is not following it and taking poison with ill intentions it will not be beneficial for him.

***Visha vega* (11)**

If anyone consumes poison in excess quantity then he develops eight *vegas*. The following table shows the *visha vegas*,

Table no.2: *Visha vega and symptoms*

Sr.no.	Visha vega	Symptoms
1.	First *vega*	*Udvega*
2.	Second *vega*	*sharir kampa*
3.	Third *vega*	extreme *daah*
4.	Fourth *vega*	person falls on the ground
5.	Fifth *vega*	there is the development of froth from the mouth
6.	Sixth *vega*	person becomes anxious
7.	Seventh *vega*	person develops stiffness
8.	Eighth *vega*	the person dies.

Vishahara mantra (12)

Mantra chikitsa should be done after a proper examination of the patient. The *mantra* should be recited seven times and water potentiated with the *mantra* should be sprinkled afterward. Once the person regains consciousness, the conch shell should be blown near his ear. This reduces the toxic effect of poison. If the intoxicated person stays far then also if the *mantra* reciter goes to his house reciting the *mantra* the effect of the poison is nullified. The person gets cured on seeing the *mantra* reciter even if thousands of attempts have been made to kill him.

Vishaghna yoga(13)

Two *Vishaghna yogas* are described in the chapter

1. *Vandhyakarkotaki* should be mixed with cow's milk it nullifies the effect of three types viz. *sthavar, jamgam* and *audbhid* poisons. *Gojihva* should be mixed with *parad* and administered with *godugdha*. This nullifies the effect of all types of poisons.
2. *Tuttha* should be mixed in equal quantity with *tankan* and administered it reduces the poisonous effect of poisons. (14)

If anyone has consumed poison in excessive quantity then *tankan* mixed with *ghrita* should be given to alleviate the effect of poison.

Conclusion

Rasamanjiri has given a detailed description of *Visha* and highlighted the importance of *tankana*. It is clearly mentioned in the chapter that *Visha* along with *tankana* becomes harmless and can be used for all diseases. The dose of *Visha* to be taken in increasing and decreasing order has been mentioned very precisely by the author. *Visha sevan kala* is also mentioned in the chapter. The importance of the *Vishaghna mantra* is also told. *Vishaghna yogas* mentioned in the text are simple and easy to administer. This article attempts to highlight the peculiarities related to poisons that are not mentioned in other texts. It will also help future *Ayurveda* scholars and pharmaceutical companies to use methods described in this book while formulating drugs with *Visha* as an ingredient.

ABSTRACT:

In ancient texts most of skin diseases are mentioned under the title of '*Kushtha Roga'*. *Vipadika* is kind of *Kushtha* which is included in the *Kshudra Kushtha*. Different Acharyas have given different signs and symptoms of *Vipadika*. As per *Acharya Vagbhata*, it is characterized by *Pani Pada Sphutana* (Cracking of the skin of palms & soles) &*Teevra Vedana* (Severe pain), *Manda Kandu* (mild itching) & *Saraga Pidika* (red patches of soles). It is chronic and recurring condition. It is predominantly *Vata* and *Kapha Doshaja Vyadhi*. Based on the clinical features it can be resemble with palmo-plantar psoriasis. In present case report, A 49-year-old female patient with complaint of excessive dryness, pain and fissures in palms and soles since 3 & ½ years (on & off). She was clinically diagnosed as a case of *Vipadika* (Palmo-plantar psoriasis). The patient was treated with classical Ayurvedic management of *Kshudra Kushtha*. After 1 month of follow up patient had significant relief in symptoms end of three months of treatment.

Keywords: -*Vipadika, Kushtha Roga, Ayurvedic* management

INTRODUCTION

In ancient classical text, *Kushtha* is the broad term use for all the skin diseases.18 types of *Kushtha Roga* mentioned in *Charaka Samhita*.[1] Which is divided into 7 *Maha Kushtha* and 11 *Kshudra Kushtha*. *Vipadika* is one of the type of *Kshudra Kushtha.* As per *AcharyaVagbhata*, it is characterized by *Pani Pada Sphutana* (Cracking of the skin of palms & soles), *TeevraVedana* (Severe pain), *Manda Kandu* (mild itching) & *Saraga Pidika* (red patches over soles).[2]

In modern science it can be correlate with Psoriasis. It is an autoimmune disease and chronic inflammatory condition. It may be localised to the palms and soles which is known as palmo-plantar psoriasis. It is characterised by red, dry and generalized thickening and scaling of the entire surface of palms and soles with deep and painful fissures which produces significant functional disability. As such, they are associated with substantial impairment in quality of life. Exact cause of Palmo-plantar psoriasis is unknown. However, it is caused by a combination of genetic & environmental factors.[3] Specific gene involvement, smoking, irritants, repetitive trauma are the causes of it. Patients may experience exacerbation carried on by seasonal changes, household work & detergents. It is not easily treated so we have to focus issues like palmo-plantar psoriasis.

Case study

A 49-year-old female patient consulted in Outpatient Department of Kayachikitsa Aarihant Ayurved Hospital, Gandhinagar in November,2022. She was complaints of the cracks on both soles and palms, scaling with severe pain followed by itching with difficulty in walking since last 3 & 1/2 years.

Present Illness

Patient comes with complaints of cracks on both soles and palms, scaling with severe pain followed by itching & difficulty in walking since last 3 & 1/2 years. She took allopathic medicines at nearer hospital. She got temporary relief in symptoms. But again, she was suffering from above symptoms (on & off). So, she took allopathic medicines for 1 year continuously but she didn't get complete relief. So, patient comes at Kayachikitsa OPD of Aarihant ayurveda Hospital, Gandhinagar with the hope of permanent cure.

Past History

No H/o DM, HTN, any Allergy.

Treatment history

Patient was locally applied clobetasol ointment.

Family history

Not significant.

Menstrual and Obstetric History

Married, $G_2 P_2 A_0 L_2 D_0$

Menarche started at the age of 12 years.

Menstrual cycle was Regular (4-5 days/28 days)

Menopause before 4 years.

Personal History

Patient was vegetarian, appetite was good. Patient had sound sleep. Bowel habit was constipated (once in 3-4 days since 5 years), Micturition was normal with frequency of 4 to 5 times in day & 1-2 times at night.

On examination

Patient had the multiple cracks over both soles and few cracks on both palms with itching, dryness, severe pain on walking was observed. And blackish discolouration on both soles. surface was rough, dry and margin was irregular.

Patient was found to be irritable, depressed due to functional disability, had a *Madhayama Kostha.* Patient had *Vata Kaphja prakriti* with *Madhyama Sara*, *Madhyama Samhanana* (Moderate built). *Pramana* was having *Madhyama*, patient having no allergy to any food & drug (*Madhyama Satmya*),*Madhyama Vyayama Shakti, Aahara Shakti* was *Madhyama.*

Management

Internal medications

Table no. 1 : Intervention

Sr.No.	***Aushadha***	***Aushadhamatra* with *anupana***
1.	*Panchatikta ghrita*	10 ml BD on empty stomach with lukewarm water
2.	*Gandhaka Rasayan vati*	500 mg TDS with lukewarm water (After food)

External application

Soak palms & soles in the boiled water with *Tankan*(alum)*Bhasma* for 20 minutes then completely dry it with cotton cloth then apply *Jatyadi Ghrita* on palms & soles.

Mode of action of *Panchatikta Ghrita*:

Panchatikta Ghrita contains *Panchatikta ghana Dravya, Ghrita* & water. All contents are having *Tikta* (Bitter), *Katu* (pungent) *Rasa*, along with *Sheetavirya*(Potency) which helps to pacify the *Tridosha*.[4]

In this case *Rukshta* (Dryness), *Pani-pada Sphutana*(fissures of soles & palms) *Twaka dalana* (Dry Scaling), *Shyava Varna* (Blackish discoloration) etc symptoms are due to *Vata Dosha*. Here,*Vata dosha* get subside by above said properties. also, *Laghu*(light), *Ruksha*(dry), *Sheeta* (cold), *Snigdha* (oily) properties acts combined & helps to subside *Kandu* (Itching) due to *Kaphadosha* & also *Daha* (burning sensation) due to *pitta dosha*. It also has anti- microbial effect (*Rakshoghna*), *Deepan*, *Vaya Sthapaka, Rasayana(*Rejuvenating property), *Balya,* anti-inflammatory properties, hydration effect.

Mode of action of boiled water with *Tankan bhasma*:

Tankan is a *Kshara*. *Kshara* has property of *Ksharan*(cutting). It is *Katu* in *rasa*, *Katu rasa* acts as *Kleda-nashaka*(destroy the excess moisture), *Kandu-Nashaka*(subside the itching), *Mamsa-Vilekhana*(scrapping the dead tissues), *Vrana Avasadaaka*(helps in the removal of excesively projected tissues in wound). Here, in this case it is used with boiled water for the *Vrana-Ropana*(wound healing) action and softening the skin of soles & palms. That helps to improve the skin texture of palms & soles & leading to healing of cracks.[5]

Mode of action of *Jatyadighrita*:

Jatyadi ghrita contains *Jati, Kushtha, Padmaka, Daruharidra, Lodhra* like *Dravyas*. The majority of the *Dravyas* of *Jatyadi ghrit* contain *Tikta, Kashaya Rasa Laghu, Ruksha* & S*nigdha gunas*. It has *Vrana-shodhana*(Cleaning the wound), *Ropana*(healing property), *Pooti-hara* action.

It also has anti-microbial activity, anti-oxidant, anti-inflammatory action and it promotes the shedding of dead tissues and necrotic tissues and promotes healing of cracks, antifungal properties, analgesic, soothing and healing action on skin lesion, anti-septic properties. Overall, the healing effect is getting by the application of *Jatyadi ghrita* over cracks.[6]

Mode of action of *Gandhaka Rasayan Vati*

It contains *Suddha gandhaka*(pure sulpher), *Chaturjata*, *Triphala*, *Suntha*, *Guduchi* etc. It acts as *Kushtaghna*, *Kandughna*, antimicrobial action, blood purification, anti-toxin action, which helps in curing the *Vipadika*.[7]

The above treatment was continued for 3 months. In first 1 month of treatment patient got significant relief in symptoms of fissures of palms & soles, itching, burning& in pain. Gradually healings of fissures were seen. And after those 3 months of treatment patient got significant relief in symptoms.

Result

Table No 02 Effect of therapy on signs and symptoms

DISCUSSION

As above mentioned case, patient was diagnosed as a case of *Vipadika*. Treatment was planned as per classical principles of *Kushtha Chikitsa.*

Vipadika is mentioned under the *Kshudra Kushtha*. It is *Vata* and *Kapha Dosha* dominant disease. Based on clinical features of *Vipadika*, it can be correlated with Palmo- Plantar psoriasis. In this case patient had difficulty in walking due to pain, excessive dryness of soles and palms and also sometimes bleeding occurs from cracks of soles. She took allopathic treatment but she didn't get proper relief so, she came to Kayachikitsa Outpatient department of Aarihant Ayurved Hospital for Ayurved treatment. Patient was treated with *Panchatikta ghrita Snehapana* internally and palms & soles soaked in boiled water with *Tankan bhasma* followed by local application of *Jatyadi Ghrita*.

Medicines used for skin diseases have qualities of *Shodhan* and *Shaman*. *Panchatikta ghrita* has *Dipana*, *Snigdha*, *Tridoshahara* action, *Kantikaraka*, anti- microbial effect (*Rakshoghna*)effect, *Vaya Sthapaka*, *Rasayan*

anti-inflammatory properties, hydration effect. Boiled water with *Tankan Bhasma* helps to improve the skin texture of palms & soles by softening of skin & leading to healing of cracks. *Jatyadi ghrit* has *Tikta*, *Kashaya Rasa Laghu, Ruksha* & *Snigdha Gunas.* It has *Vrana shodhana, Ropana, Pooti-hara karma*, anti-microbial activity, anti-oxidant, anti-inflammatory action and it promotes the shedding of dead tissue, necrotic tissues and promotes healing of cracks, antifungal properties, analgesic, soothing and healing action on skin lesion, anti-septic properties.*Gandhaka Rasayan vati* acts as *Kushtaghna* and *Kandughna* which helps in curing the *Vipadika*.

CONCLUSION

In above case study *Ayurveda* management provides the significant relief in three months of treatment. It can be concluded that with applying classical *Ayurvedic* principles & following properly *Pathya-apathya* by patient, the case of *Vipadika* shows excellent improvement and no any side effects were seen.

IMPACT OF INDIVIDUAL FACTORS, SOCIAL FACTORS AND ORGANIZATIONAL FACTORS ON EMPLOYEES' RESILIENCE

Ravindra Dey[1], Dr. Sourbhi Chaturvedi[2]

Article History: Received: 27.05.2023 **Revised:** 10.06.2023 **Accepted:** 31.07.2023

Abstract

Resilience is a crucial aspect in today's workplace as it is linked to employee performance, loyalty, and job satisfaction. It's therefore important for organizations and individuals to study resilience. This study aimed to identify the individual, social, and organizational factors that influence resilience among employees. Resilience is crucial for organizations to cope with adversity and hardship, and individuals who lack resilience are more likely to feel overwhelmed and use harmful coping mechanisms. The study examined the impact of individual and social factors, as well as organizational culture and commitment, on employee resilience. The participants in this survey were working individuals from various sectors/ industries and data was collected from a sample of 150 people comprising 79 females and 71 males. The data also contains responses from generations X, Y and generation Z. The research suggests that there is a moderate to a high degree of positive correlation between resilience and individual factors, social factors, organizational culture, and organizational commitment. Specifically, individual factors such as self-assurance, personal vision, flexibility, organization, problem-solving skills, and proactivity are positively correlated with resilience. Social factors such as interpersonal competence and social connectedness are also positively correlated with resilience. Additionally, organizational culture factors such as achievement and affiliation are positively correlated with resilience, while continuance commitment does not correlate with resilience. Employers and organizations can benefit from this knowledge by investing in programs and policies that promote the development of these factors in their employees, which can lead to increased resilience and better job performance. Additionally, identifying and addressing factors that may be hindering the development of these factors in employees can help create a more supportive and resilient work environment**.**

Keywords: Resilience, individual, social, organizational commitment, organizational culture

1. Introduction

The positive psychological power to rebound, and bounce back from adversity, uncertainty, conflict, failure, or even good change, progress and increasing responsibility have been termed organizational resilience. Personal resilience can therefore be described as an individual's ability to cope with adversity either by himself or with the help of society, even in the worst of circumstances.

Given that employees spend roughly one-third of their day at work, the importance of workplace resilience cannot be emphasized. Resilience is becoming a more important aspect in today's workplace because it is linked to an employee's dedication to the firm and its goals. A resilient workforce can increase employee performance and loyalty which in turn contributes to employee job satisfaction. It's therefore important for organizations and individuals to study resilience as it has an impact on the lives of employees while also ensuring that the organization has a positive outlook on the future to set clear goals and a strong desire to achieve them.

1.1 Problem Statement

Organizations function because of their workforce. Individuals are required to be resilient to be able to deal with changes and adversity. Various factors tend to affect resilience. Hence this study helps us understand the impact of those factors on employees. If employees as well as organizations can withstand the threats and challenges of the surrounding, they will successfully be able to survive the turbulence.

1.2 The objective of the Study

1. To understand the significance of resilient employees in an organization.
2. To understand the impact of individual factors on the resilience of employees.
3. To understand the impact of social factors on the resilience of employees.
4. To understand the impact of organizational culture on the resilience of employees.
5. To understand the impact of organizational commitment on the resilience of employees.

1.3 Purpose

The purpose of this study was to throw light on the various individual, social and organizational factors that impact resilience amongst employees at workplace positively or negatively.

Literature Review

Resilience

(Linda and Jeffrey Russell, 2006) state that resilience is "an attitude and more like a way of thinking." It is a dynamic quality that can be altered in response to the surrounding environment. A person's resilience may be evident at times and absent at others. This is due to the variable quality of an individual's inherent resilient capacities, as well as the intensity and degree of stress or change to which that individual is exposed. Because resilience is more of an attitude than a hereditary trait, it can be reinforced and cultivated.

According to Susan Kobasa, a famous psychologist, three factors are necessary for resilience:

Challenge: Adversity is viewed as a challenge by resilient organizations and individuals. They see their shortcomings and mistakes as opportunities for growth.

Commitment: Resilient employees in the organization dedicate their lives to the company, thus making the organization resilient as a whole.

Control: Even when an organization is facing tremendous pressure and employees are put on the spot, resilient organizations devote their time and energy to situations

they have some influence on. Resiliency has therefore been defined as the ability to successfully cope with adversity in the realm of human development (Werner; Smith, 2001) and can evolve throughout time as a result of one's growth and interactions with the environment (Kim-Cohen; Turkewitz, 2012).

Individual factors and Resilience

Individual (also known as personal) resilience refers to "a person's ability to cope with stress and adversity while continuing to function effectively in the face of setbacks, failures, and losses". This necessitates the development of appropriate coping mechanisms. People who can persevere and perform at a high level in the face of adversity have a strong belief in their potential to succeed and are optimistic. Resilient Individuals can look after themselves and are always optimistic and confident in their ability to overcome current and future challenges.

Resilient individuals possess the following key characteristics:

1. Self-Assurance: They have a strong belief in themselves and their abilities to handle challenges with real hope and optimism.
2. Personal Vision: They have a clear sense of their life purpose and mission, based on their abilities, interests, personality, values, objectives, skills, family, and life experiences.
3. Flexible and Adaptable: They are open to new experiences and can adjust to changing situations while staying true to their life purpose/vision.
4. Organized: They create structure and order to provide concentration and stability in the face of difficult times.
5. Problem Solver: They can identify the root cause of problems and come up with lasting solutions.
6. Proactive: They take control of their fate by actively participating in change and striving to increase their influence over a situation.
7. Determined: They have a strong willpower and firmness of purpose to persevere and succeed despite challenges or obstacles.
8. Enduring: They have the ability to withstand physical discomfort and mental stress to achieve their goals.
9. Recuperative: They have resilience and can bounce back from setbacks or injuries to return to normal functioning.
10. Self-Aware: They understand their thoughts, feelings, and behaviors, and their impact on others.
11. Self-Motivated: They are internally motivated and passionate about achieving their goals, persisting in the face of challenges and setbacks.

Social factors and Resilience

The term "social resilience" refers to "the ability of members of a group to maintain their well-being in the face of adversity" (Hall & Lamont, 2013b, p. 13). Some studies describe social resilience as "people's, social units', and social systems' ability to cope with, tolerate, and/or recover from calamities" (Khalili et al. 2015), describes social resilience as, "a community's ability to endure external social shock with the goal of improving social capacity to bear disaster losses during disasters and regenerate after disasters." Socially Resilient Individuals possess the following characteristics: Interpersonal competence, and Socially Connected.

- **Interpersonal competence** is a term that is sometimes used similarly to "social skills" and "social competence." There is no universally acknowledged meaning of this phrase due to its pervasiveness. Because so much of professional life revolves around human relationships, Fontana (1990) defines

social skills as "the ability to handle professional relationships effectively".

- **Socially Connected** refers to the strength and quality of a person's personal and professional relationships. Resilient individuals have a strong network of relationships that they can rely on for support, problem-solving, and encouragement during difficult times. Social connections and networks are essential for survival, as they provide a sense of belonging and understanding. The concept of connection is defined by experts such as Edward Hallowell, MD, and Jane E. Dutton, Ph.D., as feeling a part of something larger than oneself and having mutual knowledge and social interaction with others. Social support models include both a structural dimension, which includes network size and frequency of social interactions and a functional dimension, which includes emotional and instrumental components. While both dimensions are important, research suggests that the quality of relationships is a stronger predictor of good health than the number of interactions.

Organizational Culture

According to Poskiene (2006: 47), organizational culture "refers to the complex set of ideologies, traditions, commitments, and values that are shared throughout the organization and that influence how the organization conducts its whole performance becoming a potential source of innovation, advance and advantage". Organizational culture is the sum of values and rituals which serve as 'glue' to integrate the members of the organization. In this view, culture is about "the story" in which people in the organization are embedded. Organizational culture, according to Hofstede (1980**)**, is "the collective programming of the mind that distinguishes members of one organization from those of another." This comprises shared ideas, beliefs, and practices that set one organization apart from another.

Adaptability, according to Schein (2010), is an organization's ability to recognize and respond to external stimuli. To solve external adaptation difficulties, a strong organizational culture necessitates a set of basic assumptions that are planned, disclosed, and developed by organizational members (Cian & Cervai, 2014).

David McClelland's motivation theory suggests that humans have three basic categories of emotional needs that they acquire throughout their lives. These needs can influence behavior and performance in the workplace. Different individuals may have different levels of these needs, and organizations may have a dominant culture that reflects the prevalent need. By understanding our own needs and those of others, we can improve our self-awareness, self-management, decision-making, and overall ability to work effectively with others.

McClelland's motivation theory suggests that individuals have three basic needs:

- **Achievement:** The need for achievement is defined as, "the desire to achieve greatness in one's accomplishments by one's own efforts" (McClelland et al. 1953). Individuals with a high need for achievement have a strong drive to perform better than their peers. People with a high need for achievement are also found to be more effective leaders and to be happier in occupations that are hard and need a high level of competence. When it comes to issue-solving, such people are known to be quite persistent.

- **Affiliation:** It is defined as a person's desire to engage in cooperative and participatory activities (McClelland, 1976). Those who score well on this dimension are likely to spend a lot of time

looking for opportunities to interact with others (McClelland & Koestner, 1992). The desire for connection manifests as an emotional yearning to be liked and accepted. Individuals with a high demand for connection seek out amicable and collaborative workplace relationships as well as a pleasant social environment.

- **Power:** The desire for power, according to McClelland, signifies an "individual's desire to be influential" and involves attempting to persuade others to behave in a way that one desire or that they would not otherwise. As per (Veroff, 1992) those with strong power requirements want to remain in status-driven and competitive environments, attempting to collect status symbols. Individuals who have a strong desire for power want to be respected and have authority over others. Those who score high on this dimension enjoy competitive and status-oriented circumstances. Understanding these three basic needs can help individuals better manage themselves and others in the workplace.

Organization commitment

The term commitment means "engagement or involvement that restricts freedom of action" (Oxford Dictionary). Initially, for an employee, commitment depends on his or her perspective or expectations. Later it depends on various other factors such as job satisfaction, salary, relation with co-workers, etc. As time passes by, organizational commitment tends to become stronger because individuals develop deeper bonds with the organization and their co-workers as they spend more time with them; seniority is often helpful and tends to bring more positive attitudes; and also opportunities in the job market may decrease with age, causing workers to become more strongly attached to their current job (Hellriegel, 2001). The three-component model developed by (Meyer and Allen, 1997) arguably dominates organizational commitment research. The research on organizational commitment explains the behaviour of people concerning their commitment level to the organization Meyer et al, (2002). Some people do their job because they love them, and some do it because their goals are aligned with those of the organization. Some people stay because they fear what they might lose if they quit and some others stay because they feel there is a sense of obligation that they have to follow towards the organization. The research helps us identify 3 different types of commitment levels and those are:-

- **Affective commitment** refers to "the employee's emotional behavior, identification, attachment and involvement with their organization." (Meyer, J. P., & Allen, N. J., 1991). Employees that are emotionally dedicated to staying with the organization are doing so because of their working relationship, which is in line with the organization's values and principles (Beck, N. & Wilson, J., 2000). In general, affective organizational commitment is a one-of-a-kind system that determines the degree to which an organization is linked to a specific person (Allen N J and Meyer J P, 1990).

- **Continuance commitment** refers to "the employee's commitment based on the value associated with their organization." This is in contrast to affective commitment, in which people stay with a company because they want to and because they are familiar with the company's values. Continuance commitment can be viewed as an attack on the organization, in which a person's affiliation with the organization is solely dependent on an appraisal of the financial benefits acquired. (Beck, N. & Wilson, J., 2000). Individuals stay with the organization because of additional investments such as pension plans, and retirement, plans (Allen N J and Meyer J

P, 1990). However, a few research concluded that Continuance Commitment did not appear to be related to employee retention and resilience in the organization.

- **Normative Commitment** refers to "the employee's responsibility for the job and thus makes them stay with the same organization." This can be described as a sense of obligation to continue working with a particular organization (Meyer J P and Allen N, 1997). People who consider the moral commitment to continue inside a given organization, regardless of how much improvement in the state of fulfillment the organization affords the individual through time, are considered as the normative element (March, R. & Mannari, H., 1997).

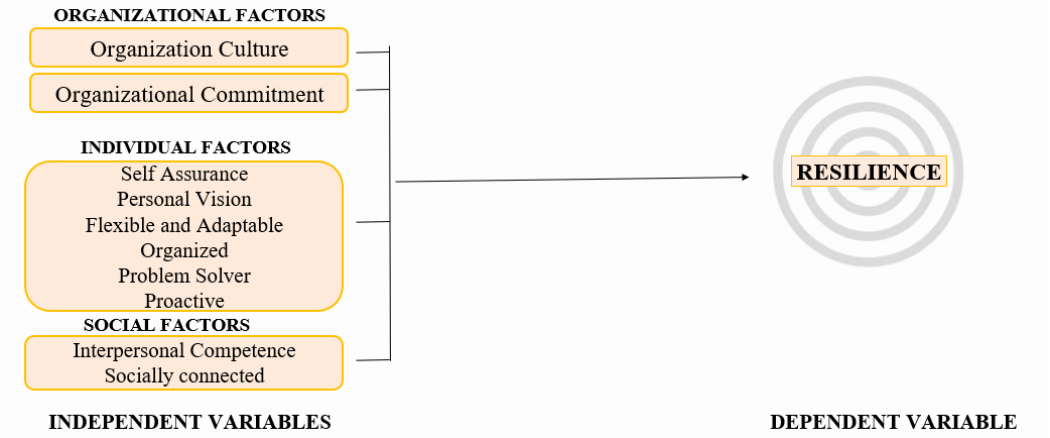
2. Research Methodology

Research Design

Primary research was conducted through an online survey questionnaire. The questionnaire was circulated to working individuals to gauge their resilience level and understand the impact of self-assurance, personal vision, organization, problem solver, flexibility & adaptability, and proactiveness on their working in the organization. The questionnaire was divided into 3 sections with 49 statements in total. The first section contained personal details like gender, age, and level of management. The second section comprised statements in regard to Brief Resilient Coping Scale (BRCS). The third section had statements on Individual factors.

Variables

In this research study, we aim to investigate the impact of various factors on the resilience of employees working in organizations. Specifically, we will examine the influence of individual, social, organizational culture, and organizational commitment factors on resilience. The independent variables in this study consist of individual factors such as self-assurance, personal vision, organization skills, problem-solving abilities, flexibility, adaptability, and proactiveness; social factors like interpersonal competence and social connections; organization culture factors such as achievement, affiliation, and power; and organizational commitment factors including affective commitment, continuance commitment, and normative commitment. These variables are expected to have a direct impact on the dependent variable, which is resilience.



It is important to note that the dependent variable, resilience, will vary depending on the level of influence exerted by the independent variables. Thus, our study

aims to understand the relationship between the independent variables and resilience and to explore how these variables collectively shape an employee's ability to cope with challenges and setbacks in the workplace.

Hypotheses

The null hypotheses of this study are as follows**:**

Ho1: There is no significant relationship between individual factors and resilience.

Ho2: There is no significant relationship between social factors and resilience.

Ho3: There is no significant relationship between organizational culture and resilience.

Ho4: There is no significant relationship between organizational commitment and resilience.

Data collection

Primary (quantitative) and secondary (qualitative) data sources were used to obtain the data for this research. The primary source comprises direct information collected through the questionnaire. Secondary data sources include research papers and related publications available online. To collect primary data, a quantitative approach was adopted through a survey questionnaire comprising 49 statements which were converted into a Google form and circulated online through social media applications/ email and responses were recorded digitally. The sample size of the study was 150. The data was recorded using a 5-point Likert scale (1 being strongly disagreed to 5 being strongly agreed)

Instrument

- Brief Resilience Coping Scale (Sinclair, V. G., & Wallston, K.A., 2004), was used to measure the degree of resilience in individuals. It comprised 4 items. Responses were scored on a 5-point scale. Higher scores indicated a greater resilience coping in the respondents.
- The resilience quotient (RQ) assessment tool (Designed by Jeffrey and Linda Russell 2006), was used to measure resilience with individual personality traits like self-assurance, personal vision, organization, flexibility, and adaptable, problem solver, proactive and social skills like interpersonal competence and socially connected. It comprised 24 items: 18 items for individual factors and 6 items for social factors. Responses were scored on a 5-point scale. Higher scores indicated a greater resilience coping in the respondents.
- Organizational culture (Designed by McClelland's theory, 1961) was used to measure organizational practices and values that impact the resilience of employees. It comprised 12 items, capturing 3 dimensions of Achievement, Affiliation, and Power. Responses were scored on a 5-point scale. Higher scores indicated a greater resilience coping in the respondents.
- Organizational commitment (Designed by Allen and Meyer, 1990) was used to measure 3 dimensions of Affective, Normative, and Continuance with the impact on the resilience of employees. It comprised 9 items. Responses were scored on a 5-point scale. Higher scores indicated a greater resilience coping in the respondents.

Sample/ Participants

The participants in this survey were working individuals from various sectors/ industries and data was collected from a sample of 150 people comprising 79 females and 71 males. The data also contains responses from generation X, Y, and generation Z which included employees of junior and middle-level management.

Sr. no	Demographic factor	Categories	Frequency	Percent
1	Gender	Male	71	47%
		Female	79	53%
2	Age	18-24	59	39%
		25-40	51	34%
		41-56	40	27%
3	Level of management	Junior level management	76	51%
		Middle level management	74	49%

3. Results and discussion/ Interpretations

Data analysis

The data was analyzed using Statistical Package for Social Sciences (SPSS). To ensure that the data was reliable, a reliability test was conducted. Cronbach's Alpha reliability index was used to evaluate the consistency of each construct. Statistical tests such as correlation analysis were conducted on this data.

Reliability analysis

The degree to which a scale produces consistent findings after multiple measurements are referred to as reliability. Reliability test analysis is used to check how reliable the data collected is. As a result, if the reliability analysis correlation is high, the scale delivers consistent results and is thus reliable. The reliability or internal consistency of the data was ensured using Cronbach's Alpha. As per the result shown in Table 01, the Cronbach's Alpha value obtained is 0.896 which indicates that the internal consistency is good and the data is highly reliable**.**

Correlation Analysis

Ho1: There is no significant relationship between individual factors and resilience

Data analysis gives a positive correlation between the independent variable individual factors and dependent variable resilience of 0.723. To deduce the relationship between the two variables, individual factors and resilience, Karl Pearson's coefficient of correlation was calculated. The significance value is 0.000 which is lesser than 0.01, hence the null hypothesis is rejected. (Refer to Table 02)

The null hypothesis

Ho1 is therefore **rejected in favour of the alternate hypothesis: There is a significant relationship between individual factors and resilience.**

An analysis between self-assurance and resilience gives a positive correlation with an r-value of 0.613. An analysis between personal vision and resilience gives a positive correlation with an r-value of 0.553. An analysis between flexibility and adaptability and resilience gives a positive correlation with an r-value of 0.573. An analysis between organized and resilience gives a positive correlation with an r-value of 0.569. An analysis between a problem solver and resilience gives a positive correlation with an r-value of 0.515. An analysis between proactive and resilience gives a positive correlation with an r-value of 0.455. (Refer to Table 02)

Ho2: There is no significant relationship between social factors and resilience

Data analysis gives a positive correlation between the independent variable social factors and the dependent variable resilience of 0.412. To deduce the

relationship between the two variables, social factors and resilience, Karl Pearson's coefficient of correlation was calculated. The significance value is 0.000 which is lesser than 0.01, hence the null hypothesis is rejected. (Refer to Table 03)
The null hypothesis
Ho2 is therefore **rejected in favour of the alternate hypothesis: There is a significant relationship between social factors and resilience.**
An analysis between achievement and resilience gives a positive correlation with an r-value of 0.404. An analysis between affiliation and resilience gives a positive correlation with an r-value of 0.230. An analysis between power and resilience gives a positive correlation with an r-value of 0.196. (Refer to Table 03)

Ho3: There is no significant relationship between organizational culture and resilience
Data analysis gives a positive correlation between the independent variable organization culture and dependent variable resilience of 0.372. To deduce the relationship between the two variables, organization culture and resilience, Karl Pearson's coefficient of correlation was calculated. The significance value is 0.000 which is lesser than 0.01, hence the null hypothesis is rejected. (Refer to Table 04)
The null hypothesis
Ho3 is therefore **rejected in favour of the alternate hypothesis: There is a significant relationship between organizational culture and resilience.**
An analysis between achievement and resilience gives a positive correlation with an r-value of 0.404. An analysis between affiliation and resilience gives a positive correlation with an r-value of 0.230. An analysis between power and resilience gives a positive correlation with an r-value of 0.196. (Refer to Table 04)

Ho4: There is no significant relationship between organizational commitment and resilience
Data analysis gives a positive correlation between the independent variable organizational commitment and dependent variable resilience of 0.254. To deduce the relationship between the two variables, organizational commitment and resilience, Karl Pearson's coefficient of correlation was calculated. The significance value is 0.002 which is lesser than 0.01, hence the null hypothesis is rejected. (Refer to Table 05)
The null hypothesis
Ho4 is therefore **rejected in favour of the alternate hypothesis: There is a significant relationship between organizational commitment and resilience.**
An analysis between affective commitment and resilience gives a positive correlation with an r-value of 0.285. An analysis between normative commitment and resilience gives a positive correlation with an r-value of 0.368. An analysis between continuance commitment and resilience gives no correlation with an r-value of -0.004. (Refer to Table 05)

Limitations
The sample size for the study is only 150, hence the statistical tests may not have been able to identify the accurate significant relationships between the different variables which further reduces the scope of the study. A larger sample size would provide a more accurate data analysis. This research paper focuses on a few individuals, social, organizational culture, and organizational commitment factors that influence the resilience of employees. However, several factors have not been taken into consideration but have an impact on the resilience of employees in an organization. In terms of demographics, the study focuses solely on management level, age, and gender; and could have further explored additional

demographic characteristics such as work experience and growing environment, both of which play a key role resilience of employees. Due to limited responses from top-level management and individuals in the age group 57 and above, the data was omitted in this study to ensure that the currently collected data gives accurate data analysis.

4. Recommendations and Conclusion

The study recommends conducting more extensive research that includes a larger sample size of professionals from various sectors and years of experience to determine if specific sectors or employee experience levels have a stronger correlation to resilience. Employers should be aware of the factors that promote employee resilience and use that knowledge to retain highly resilient employees. In conclusion, the study suggests that to be resilient, employees need to have confidence in their abilities, organize their behavior to achieve their goals and approach problems positively. Organizations should recognize the importance of employee resilience in achieving organizational outcomes and invest in programs and policies that develop individual and social resilience, organizational culture, and organizational commitment. Identifying and addressing factors that hinder the development of these factors in employees can help create a more supportive and resilient work environment.

Annexure

Appendix 1: Questionnaire

Instructions: Read each of the following statements and, using the 5-point scale, indicate the extent to which you agree or disagree that each statement accurately describes how you perceive yourself and your organization.

1	2	3	4	5
Strongly Disagree	**Disagree**	**Neutral**	**Agree**	**Strongly Disagree**

Factor- Wise Bifurcation

BRCS	
1	I look for creative ways to alter difficult situations.
2	Regardless of what happens to me, I believe I can control my reaction to it.
3	I believe I can grow in positive ways by dealing with difficult situations.

4	I actively look for ways to replace the losses I encounter in life.
Individual Factors	
5	I believe that I have the knowledge, skills, and abilities to deal with almost anything that happens to me.
6	I think and speak positively about myself and my abilities when facing a challenge or stress.
7	When I face great challenges, I look within myself for the answers about what to do and how to respond to the challenge.
8	I know what's important to me in my life.
9	When I look back on my life, I see a clear pattern in the choices and decisions that I have made.
10	I know what I need to do to achieve my personal and professional goals.
11	I approach new situations with an open mind as to what needs to be done.
12	I am willing and able to make adjustments to my goals and plans when situations and expectations of me change.
13	I find that most of the time, I am able to find a way to meet both my needs and the needs of others in a changing environment or during a conflict.
14	When faced with a major change, I usually find a way to create systems or structures that give me a degree of control that I find useful and helpful.
15	I start each work day by thinking about what I need to accomplish during that day and I end each day reviewing what I need to accomplish the next day.
16	I usually maintain some sort of a "to-do" list to help me focus on what I need to work on.
17	When I have a problem to solve or a decision to make, I usually spend time defining the problem or decision.
18	I see the problems that I face in life and at work as challenges that I can solve.
19	When I solve problems or make decisions, I try to identify the relationships between the problem I am solving or the decision I am making with other issues, problems, and challenges.
20	I view change - even difficult and challenging change - as an opportunity for me to learn and grow.
21	When an unwelcome change is forced upon me, I can usually find a way to either influence the course of the change or find a way to make the change work for me on my terms.
22	Rather than focusing on what others are doing to me, I tend to focus my energy on how I can make the best of a situation.
Social Factors	

23	In social interactions at work and in my personal life, I am usually able to laugh at myself when appropriate.
24	In stressful or conflict situations I am usually able to maintain effective relationships with others.
25	I value the diverse beliefs, approaches, and methods that people bring to their work and their daily interactions with me.
26	I have a diverse group of people whom I consider good friends.
27	I find it easy to form lasting friendships.
28	I regularly participate in one or more non-work-related group activities with friends (e.g., church, sports, cultural, etc.) where I can let off steam, learn, grow, and have fun.
Organization Culture	
29	People in my organization are concerned about achieving goals and meeting standards of excellence in performance.
30	People in my organization interact with each other to improve their performance and achieve goals.
31	People in my organization challenge others' ideas or work to improve performance.
32	Good performance is recognized and encouraged in my organization.
33	There is warmth and friendliness in relationships between most people in my organization.
34	There is frequently informal and friendly interaction among people in my organization.
35	There is a lot of cooperation and helpfulness among people in my organization.
36	People in my organization are helpful to each other in times of difficulty.
37	People in my organization are very concerned about status, position and power.
38	There is a tendency for people in my organization to engage in one-upmanship with each other.
39	There is a tendency for people in my organization to get into competition and rivalry with others.
40	Informal cliques tend to develop to promote or protect the interests of a few in my organization.
Organization Commitment	
41	I am quite proud to be able to tell people who it is I work for.
42	I sometimes feel like leaving this employment for good (R).
43	I am not willing to put myself out just to help the organization (R).
44	Even if the firm were not doing too well financially, I would be reluctant to change to another employer.

45	I feel myself to be part of the organization.
46	In my work, I like to feel I am making some effort, not just for myself but for the organization as well.
47	The offer of a bit more money with another employer would not seriously make me think of changing my job.
48	I would not recommend a close friend to join our staff (R).
49	To know that my own work had made a contribution to the good of the organization would please me.

Abstract: Microfinance institutions (MFIs) provide support for the sustainability of livelihood and financial inclusion through social development. Micro-enterprises helps in empowering the communities especially marginalized section worldwide. The MFIs attempt to transform the lives of poor people, through different interventions. It revolved around the social development of marginalized people. In recent decades, microfinance played a vital role in alleviating poverty and involved empowering low-income earners socially and economically. The present study intended to highlight the role of MFIs located in Jabalpur (Madhya Pradesh) in enhancing the social and economic status of beneficiaries. This study also acknowledges the significance of MFIs in eradicating poverty, through financial services. In this research, questionnaire responses were gathered and analyzed from 150 beneficiaries of three MFIs (Credit Access Grameen, ESAF, and Fusion Micro-finance) in Jabalpur. The exploratory data analysis reveals diverse findings, regarding the impact of microfinance on the socio-economic conditions of beneficiaries through improving their savings, supporting the employment generation, and as a whole improving life standards as well as eradicating poverty. Alternatively, MFI programs also assist beneficiaries in employment generation, to a certain extent. The conclusion of the research prioritizes that MFI programs ought to be accelerated more by the Government through different schemes and can be easily accessed to even remote areas for economic expansion and social development of low-privileged people.

Keywords: MFI-Microfinance institutions, Jabalpur, social development, economic condition financial services.

1. Introduction

Microfinance is defined as the provision of a broad range of different financial services including insurance, savings, payment services, and credit to low-income and poor people (Kumar, Chauhan, & Kumar, 2015). The poor people are deprived of reaching out to formal financial institutes since they fail to provide collateral. Microfinance was identified as a beneficial tool in combatting poverty and fulfilling the basic requirements of the poor consistently and independently. This provides small-interest credit services to poor people and can exploit employment opportunities and expand the present business activities.

The non-government and government microfinance institutes were performing in African and Asian countries to serve the clients. In 1990, the decade is referred to as the decade of Microfinance, and a new Micro-credit Summit was launched to develop small businesses in 1997 for poor people empowerment. Nearly one hundred and seventy-five million poor households and women population within families had focussed on reaching the micro-credit Summit (Rehman, Moazzam, & Ansari, 2020). Similarly, in 2005, the United Nations announced this year to be the International Year of Micro-finance, because of MFI's contribution to minimizing the poverty vulnerability globally. (ADB) Asian Development Bank, comprises two different primary sources such as offering microfinance to needy people, informal institutes, and semi-formal and formal institutes. The Co-operatives and rural banks were playing a predominant role in developing nations as formal Microfinance streams. The primary part of MFI narrated its key objective to be fascinating micro-credit to the low-income people, who were not able to provide the collaterals to those MFI (Farghly, Saleh, Youssef, & Bary, 2018). The activities of MFI encompasses offering small loan amount since the MFI client consists of daily wage people or low-income earners. These people may generally have constrained access to different financial services such as remittances, insurance, savings, and loans. The MFI paves a road path to explore the small business of these low-income earners. The loans were offered for various benefits like the development of micro-enterprise and their establishment.

The major goal of this MFI is to provide consistent financial services like savings and credit to relieve the low-income bearers (poor) from financial constraints. The MFI aids in eradicating poverty in society concern. Irrespective of whether it is profit-oriented or not like so, every MFI attempts to increase the performance of repayment. Both borrowers and MFI were greatly related to higher rates of repayment. The higher rates of interest enable MFI to minimize loans' financial costs and to permit more count of borrowers in their accessibility by eliminating charged interest rates to those borrowers. For example, usually, there are three categories of institutions such as commercial and specialized banks, (NGO) non-Governmental organizations, and been operated using BARDM BRDB, RDA, ministry of

government, or other departments. But also this micro-finance plays a vital role in developing the social status of low-wage people or in the empowerment of people through business or loans (Zahir, Al Mamun, & Shrestha, 2020).

Many recognitions and achievements are claimed about micro-finance activities effects and foreign-observer could not however wonder at the broad level of amenities bought down by MFI. For different socio-economic reasons, Bangladesh is one of the poorer countries, wherein half of the entire population lives below the line of poverty at this time. Hence, the reduction in poverty and generating rural employment for those people stand as the topmost priorities, for the government of Bangladesh (AHAMAD, BHUIYAN, SOLAIMAN, & JOARDER, 2021). Hence the government initiates a wide approach for alleviating poverty, to improve the economic status of the public and nation through emphasizing economic independence, support for MFI, empowerment, and macro-economic stability. In this approach, MFI turned out widespread throughout the nation and aided in expanding the economy and alleviating poverty tremendously. In Bangladesh, some of the examples of leading MFI were ASA, BRAC, and Grameena Bank (Chouksey & Karmarkar, 2019).

Across the World, MFIs try to construct a unique kind of tripod in financial inclusion, and sustainability of livelihood through social development and micro-enterprises to empower communities of marginalized sections. The research spoke about the involvement of MFIs in preventive healthcare, financial literacy, livelihood promotion, capacity building, training and education, sanitization and water, etc. beyond the core financial activities like micro-credits to the poor. Out of 23 MFIs operate 20 backward districts in Madhya Pradesh. MFIs shifted the focus to states like Uttar Pradesh, Madhya Pradesh, Bihar, and Rajasthan; the states from south India like Tamil Nadu, Kerala, and Karnataka indicate greater penetration of MFI, in the backward districts and commensurate with overall greater penetration across these India states. However, it has been a contradiction that the work of MFIs done only in backward districts and backward states. MFIs operate currently in 568 districts, 28 states, and 5 union territories in India (Jamal & Mazhar, 2019).

Indian MFIs extended their environmental outreach and also associated their footsteps in the arena of social development in a wide way. Particular thrust area with social development where the Indian MFIs are active includes financial literacy, preventive health care, capacity building, livelihood promotion, training and education, sanitation and water, etc. (Lindahl & Mokvist, 2020). In the existing study particular important interventions by many MFIs have been revised to cause more actions on borders also with particular discourse and academic research on the subject. According to the Bharat Microfinance report, several MFIs have been involved in socio-developmental initiatives such as preventive healthcare (45), water

and sanitation (35), financial literacy (51), training (56), capacity building (35), education (31) and livelihood promotion (56) (Mohd, 2018).

There lies a powerful argument for central bank authorities and regulators, to expand the efforts rapidly at stabilization of the financial sector to indulge all Microfinance norms. The industry of Microfinance was connected closely with the rural economy by offering micro-credit to non-financial services and smaller businesses to poor households. With the rapid progress of micro-finance activities, several studies in identified MFI programs' effects on poverty reduction, and some researchers also emphasized assessing the impacts of micro-credit and savings services on the living standards of the people. The parameters such as social and economic progress are lacking in the existing studies with detailed quantitative analysis as well as empirical evidence.

Today Microfinance movement seems thriving and large, evidenced by the existence of 916 MFI. Having an approximate aggregate loan portfolio, constituting 124 billion dollars. MFI had nearly 140 million active borrowers, globally in the year 2018, of which 80 percent of them were women and 65 percent of the population are people residing in rural regions. To incorporate more services, both non-financial and financial, microfinance orientation diverges from lending to low-income people to pursue double bottom-line goals of financial sustainability and outreach (Zamore, Beisland, & Marsland, 2019). In today's era, MFI Serves hundreds of millions of borrowers hence playing a key role in uplifting societal and economic status and alleviation poverty in developing nations, specifically in Pacific and Asian countries. MFI were the invincible knights to shine armor on a mission to eradicate salvage and poverty. The financial stability of the population is yet a concern for MFI, and it should essentially behave like other firms, focused on being profitable (Zamore et al., 2019). Even though like another financial sectors like commercial banks, MFI were evaluated commonly with regards not alone to profits but to other social impacts.

The role of micro-finance whether local or global is to provide financial services and substantial financial flow to economically marginalized populations, who are often ignored by the formal financial stream. With the evolution of microfinance, in developing economies, the people excluded from the traditional financial system, possess access to alternatives in saving and borrowing, instead of having dependency on friends and family. MFI possesses considerable changes in socio-economic conditions, and ought to be assessed, prior to rectifying the gaps. Microfinance can maximize self-employment and evolve in creating microenterprises (Nogueira, Duarte, & Gama, 2020). With the support of micro-finance, in many developing nations, the household was capable of expanding opportunities for income accumulation, hence permitting people to offer to their respective families. By

having accessibility to credit, could aid in recovering from poverty, in immediate terms, in disruption of the poverty cycle, hence facilitating business opportunities.
Through the assistance of micro-finance, entrepreneurs in developing nations, and impoverished communities, might operate, survive, and even thrive by generating more employment opportunities. Participation in microfinance programs, related to high consumption levels, better nutrition commonly uplifted living standards, and progressing economies (Nogueira et al., 2020). In spite of the inherent purpose, of acquiring good benefits, it seems crucial to acknowledge MFI is not without any faults, a few of them include, driving client over-indebtedness, exorbitant interest rates, questionable record upon female empowerment (Garikipati, Johnson, Guérin, & Szafarz, 2017), overemphasis upon credit instead of other related financial services, lacking in explaining the impacts on reduction of poverty.
The need to reconsider MFI claims, both about the economic and societal impacts upon households. The profitability of microfinance as a business enterprise, which serves low-income households. The claims about profits and large were exaggerated, however, it should have claimed about its failures. There is significant, heterogeneity, in profit and impacts, and micro-finance holds real appeal in certain contexts, specifically if communities are fundamentally under-served. The expectations for effects are set higher through microfinance pioneers. Hence the impact of MFI to overcome, financial constraints, economic status, and societal parameters from the perspectives of the public is always a necessity gap to fill in, and thus it could radically expand the public opportunities to earn, in pre and post-accessibility to MFI benefits.

1.1 Problem Identification

It had been recently determined that instead of reducing poverty, the Microfinance program maximized income generation and consumption, however microfinance scenario, fails in supporting sustainable business-enterprise, for certain reasons. The micro-finance institution ensures the empowerment of the economy to a higher degree of extent. There lies a huge necessity to arrange the credit-plus programs through MFI, to attain more and more empowerment of its beneficiaries. Few researchers had disclosed that these MFI programs would not contribute properly towards the socio-economic development of the nation and in alleviating poverty as per expectation. The significance of the MFI and its schemes, with evidence outcomes, ought to be emphasized to circulate awareness to the public and to attain the benefits. The existing research has explicated that the impacts of Microfinance on assets and income are not important for all the regions of Bangladesh, however, its micro-credit possesses significant effects on expenditure or consumption (Ray & Mahapatra, 2019).

The micro-finance loan will be utilized for consumption expenditure sources. The credit holder spends the money on non-economic activities (Vassallo, Prabhu, Banerjee, & Voola, 2019). Hence at the instalment of repayment, poor credit ought to borrow the amount from various sources and hence the situation became highly complicated for the populace. Therefore, the study focuses on the performance of micro-finance programs and their impact on social development.

The present study analyses the various factors such as economic conditions, generation of income, savings, employment, health expenses and living standards before and after getting financial aid such as loans. The results of the study highlight the impact of MFIs in improving the socio-economic conditions of the beneficiaries of the MFIs. Thus, this study brings deserving attention to the MFIs in order to improve the livelihood of the poor.

1.2 Paper organization

Section 1 states the introductory concepts of research. Section 2 enumerates the review of literature studies and its gaps, Section 3 describes the research method, Section 4 illustrates the results of statistical analysis, Section 5 presents the discussion and Section 6 defines the conclusive statement of the study.

2. Review of Literature

The below section enumerates the review of different existing studies, stating the role of microfinance in different aspects to improve society and services.

The literature on microfinance, highlights the different multitude of actors, having various categories of institutional logic that provide financial services to needy and poor people. However, it has not been defined, how the logic classification is applied. The perspective of institutional logic, MFI, enunciated how the organizational actions were shaped through shared belief, delivered towards poor people and the poorest group of societies. Hence this institutional logic, being adopted by MFI generates expectations of MFI in a similar context (Atiase, Mahmood, & Wang, 2019). Conversely, in the research of Semambo Hussein Kekambo, he stated that Islamic microfinance was noted to be a panacea towards financial inaccessibility challenges between (SME) Small and medium-sized enterprises particularly in developing countries. The objective of this research relies on examining how Islamic microfinance adoption could play a vital role in enhancing MFI sustainability whilst meeting the SME financial challenges in Uganda's regions. In the Practical model, the study would serve to be a guide to those practitioners and policymakers in the microfinance field by adding flair. This would enable bridging challenges related to inadequate SME financing in the Uganda region (Kakembo, Abduh, Hj, & Salleh, 2021).

Owing to these challenges, Sunil Sangwana, reported the research about the assessment of loan re-payment behavior, among those Clients of MFI residing in two Eastern Indian states. The contribution of demographic characteristics, loan characteristics, economic characteristics, regional attributes, and moral hazard features of client households are examined by the researcher. The inferences in this literature reveal comprehending repayment risk under uncollateralized credit and asymmetric conditions. Tracking the loan characteristics and household attributes aids the MFI in generating certain credit risk parameters and in the formulation of credit scores (Sangwan, Nayak, & Samanta, 2020).

Similarly, Jarrod P. Vassallo explored research on hybrid organizations and determined Microfinance organizations to be an ideal hybrid representation and as quintessential social innovation. The MFI is generally administered using group-lending schemes whereas conventional bank loans were not. In coping with this, the credit provision for product purchases like solar energy systems for a house depends highly on trustworthiness supervision in comparison to formal collateral (Vassallo et al., 2019). Research by Amit demonstrates that the Indian Government reinforced the microfinance program in the SGSY system to decrease rural households' poverty. Some extension of the National Rural Employment Guarantee scheme plays the aid's role. It has been evidenced that by using Natural experiments, microfinance programs can diminish the susceptibility of rural household participation. It has been completed by constructing a susceptibility index. Social parameters (Jha, 2019) include enrichment of empowerment of the contributing independent group participants who belong to categories of women under SGSY enterprise between the apprehensive time and microcredit's size that have been grabbed for profits generating schemes (Aggarwal, Kumar, & Garg, 2020). It plays a vital role in decreasing the susceptibility of the contributing rural households in the Microfinance program. The paper (Kundu, 2010) demonstrates that the microfinance program in the SGSY system can decrease the vulnerability of involvement of rural households. Microfinance programs contribute to financial services that help poor households to create renovation from day-to-day existence to plans. Few works like the river dam's construction that ranges in NREGS support the marginal agriculturalists to perform binary cropping which plays an important role in easing their susceptibility and the scarcity of household members. NREGS (National Rural Employment Guarantee Scheme- Implementations) has been playing a significant role in diminishing the vulnerability of the country's women.

Indra's research states (Widiarto & Emrouznejad, 2015) that it suggests two-stage examinations to measure the performance of IMFIs (Islamic Microfinance Institutions) by associating with the predictable MFI's efficacy in its twofold objectives regarding financial and social efficacy. During the second phase,

nonparametric tests have been used to associate the performance and pinpoint elements that contribute to the efficacy of MIFs and IMFIs.

The microfinance sector has been focused largely, on providing loans to underprivileged people without the necessities such as collateral security. The majority of microfinance firms, within India, employ Self-help groups (SHG) or any (JLG) Joint liability group models of people group lending towards issue loan facilities since the pressure acts as one of the social collateral in those models. Offering micro-loans to micro-enterprises was acknowledged as a critical strategy for socio-economic progress by enhancing the livelihood of micro-finance beneficiaries and their households. The literature review aids in determining the research gaps which might be stated succinctly. At first, the investigated literature depicts that there are various researchers on micro-finance and its impacts on socio-economic progress from different global regions, based on diverse theories. However, there were no present studies, investigating the impacts of MFI in association with metropolitan regions (Bothra & Sapra). The researchers on the impacts of MFI, in Delhi areas, were more specifically scarce. In the second stage, the majority of researchers analyzed the MFI impacts commonly, wherein some of MFI had sought to determine if there prevailed any differences according to group type of beneficiary if SHG Microfinance beneficiaries or any other JLG beneficiaries. The existing study of Sapra and Bothra attempted to fill the research gaps, by investigating the micro-finance effects on socio-economic progress. The research was capable of perceiving the micro-finance impacts by particularly assessing the effects of MFI loan experience on population, micro-finance loan accessibility, and MFI group type upon the development of socio-economic status. The Microloan accessibility was proven to improve significantly the entire socioeconomic growth of beneficiaries.

Microfinance is another efficient technique that impacts the socio-economic respondent's conditions and family members, specifically for personal purposes (loan). The stability enables families to achieve livelihood, purchase nutritious food supplements, construct house purchases, land purchases, accessibility towards contemporary health care, start up new businesses, multiple cultivations, and send their children or siblings abroad for higher studies. The existing research of Mamun and Al-Amin explored the reasons for receiving micro-credit and the effects of Micro-finance upon socio-economic enrichment, based on secondary and primary data. This analysis was accomplished through in-depth interviews, and personal interviews utilizing open-ended questionnaires, arranged with micro-credit receivers from ASA, Grameen Bank, and BRAC, and field staff, at Cumilla (Bangladesh) in the year 2021. Both snowball and random sampling approaches were adopted to choose respondents (Al-Amin & Mamun, 2022). The research highlighted that MFI generates positive differences in income response, changes in family status, and

entire socio-economic condition, yet in certain places, few borrowers, are not able to mobilize credit appropriately, which leads to the rise of bad loans. Therefore, a few recommendations were provided to reduce loan misuse and as self-reliant.

Ozdemir, Savasan, and Ulev aimed to assess the impact of Islamic microfinance on poor households through the IKSAR Qard al-Hasan Program prevailing in Turkey (Ülev, Savaşan, & Özdemir, 2023). To attain the objectives, it investigates the differences in socio-economic beneficiaries' status before availing of MFI services and after MFI services. It also utilizes longitudinal data whilst investigating the effect of Islamic microfinance on poor population welfare.

Hence the contribution of micro-finance is prominent, wherein Tunio, Talpur, and Baghal claimed to deliberate the effect of MFI upon the socio-economic empowerment of the female population in Nepal. Financial independence, decision-making competence, and self-confidence were the dependent variables. The chosen independent variables, were entrepreneurial skills, self-efficacy, insurance services, resource accessibility, and leadership skills. The primary data source was utilized to analyze the respondent's opinions regarding micro-finance programs on socio-economic women empowerment in Nepal (Baghal, Talpur, & Tunio, 2023). The research analyses twenty-three MFI with nearly 154 respondents. To attain the study objectives, a structured questionnaire was utilized. The regression model and correlation coefficients are predicted to verify the significant impact of microfinance programs on the socio-economic empowerment of women in Nepal. The outcomes of the research evidenced that leadership skills possess positive effects on decision-making ability, financial independence, and self-confidence.

The expectations for effects have been constructed by the microfinance developers. The research helps the SSE (small-scale entrepreneurs) to overcome economic constraints and radically improve their earning opportunities. The researcher of the study claimed at minimum range, that microfinance might provide money at a low-cost interest amount compared with private financiers and reduce the level of dependency on experienced trade-lenders in surpluses extraction [House of Representatives U.S., 1986]. Therefore microfinance has optimistically assured to increase income; and improve health, education, and empowerment for women with brand-new resources. The considered study perceived finance as a tool for personal renovation, and it captures the imaginary minds of those people, who seek new kinds of economic and social change. Besides establishing the probability of new modes of economic institutions, microfinance has motivated innovations accepted in various fields like education, energy, and health. Prior efforts in fostering social investment and constructing social businesses owe their motivation to the microfinance pioneers (Cull & Morduch, 2018).

The major part of the population belongs to rural Nigeria, for the financial development of women and the growth of Nigeria with the involvement of country

women in financial activities at every level seems highly crucial. The microfinance banks should improve their financial role by stakeholders due to the impact on rural women and any financial policy in the future. The policies that should be adjusted respect the effect on employment, empowerment, and financial advancement of rural women. Incentives should be given to rural women to start financial activities that develop the socioeconomic circumstance, thus ensuring the improvisation in the micro-finance sector (Maureen, Pius, Maikeffi, Samuel, & Bara'atu).

Research Gaps

MFI schemes provide opportunities for women in finance, public works, and agriculture with much-required credit, and beneficiaries' participation in those activities could accelerate the growth of the economy. It also mitigates the consequences of future and present financial crises. The role of micro-finance must be strongly stated in the nooks and corners of the nation and their benefits to rural and urban livelihood. Since the inequalities in gender hinder sustainable development and economic progress, micro-finance participation and assistance to empower society are highly crucial. Typically, the MFI was found to possess positive effects on education as well as their contribution towards the emancipation of women and gender equality. The loan arrangements by MFI, then their supportive male members, confirm the socially beneficial implication of offering easeful financial services to the public specifically the female population. Certain Myriad empirical assessments concluded that those MFI programs support people's empowerment both economically and socially. These conditions can be evidenced by, bringing out the positive counterparts of Microfinance (Hassan & Saleem, 2017).

Alternatively, The MFI policy ambiguity might have crucial implications for the future credibility and client behavior of MFI. For instance, one such MFI explored that in various districts in Pakistan, the staff heard some rumors from current clients their false rumors wherein the Pakistan Government had decreed loans of Microfinance were forgiven now to be a matter of national policy. Hence there is lacking to measure out and identify this ambiguity (A. A. Khan et al., 2021).

Several other researchers exposed that MFI programs of government acquire political interference, and it stresses out the inefficiencies related to MFI intended services distribution by political interference for instance Samurdhi Micro-finance program. Other research has determined that the Janasaviya Program was always hindered by resource misallocation and political patronage (Sangjeli & Mustafa, 2019). Those phenomena ought to be addressed in any study, to spread its awareness. The recapitalization and emergency liquidity facilities should be assumed to permit MFU to forbear present loans and stand in position for expanding liquidity management products while in control of the pandemic (Czura, Englmaier, Ho, & Spantig, 2022).

3. Research Methodology

The present study is a quantitative approach research with empirical analysis, fed with quantitative data, about the microfinance effects in the city of Jabalpur in Madhya Pradesh. The major sampling units are the Microfinance institutions in the city and the sampling units collected as secondary units are beneficiaries of chosen MFI in this Jabalpur district. The items of samples represent the local branches of ESAF, Fusion MFI, and Credit Access Grameen. Random sampling methods have been utilized to select out MFI significant branches specifically and corresponding beneficiaries of MFI micro-credit loans. The sample size of those beneficiaries is 150 obtained from Credit Access Grameen Limited, ESAF Microfinance & investment, and Fusion Micro Finance local branches. The self-administered and semi-structured questionnaires have been utilized in secondary data collection from other sources.

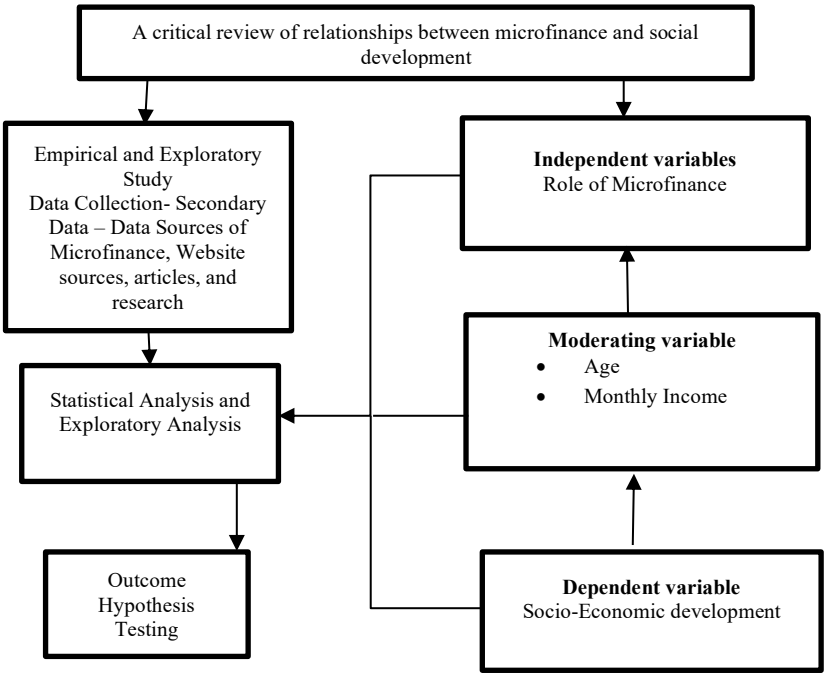

Figure 1. The research framework of the study
Source: Own processing

The Research framework as shown in Figure 1 was developed based on various independent, dependent, and moderating parameters. The empirical research propounded to elucidate the prominent role of Microfinance institutions in the socio-

economic status of Jabalpur city in Madhya Pradesh. The secondary data analysis is put forth to test the hypothesis of the study. Other moderating parameters that reveal the role of micro financial services. Statistical data are analyzed to test the hypothesis. The socioeconomic impacts are assessed through simple regression analysis. This study is a descriptive and empirical research study. The data has been collected randomly from secondary data sources such as articles, researchers, and website sources. The collected secondary data were utilized for statistical analysis through the IBM SPSS software package. The hypothesis has been tested based on the objectives of the study.
The following are the research hypotheses framed for the study.

H1: There is a significant impact of microfinance services on the savings, income generation, living standard, and employment generation of the beneficiaries.
H2: There is a significant association between monthly income and age characteristics of beneficiaries in MFI with economic and social development.

The common goal of the research is to analyze the effects of micro-finance programs on beneficiaries of Jabalpur (Madhya Pradesh). The peculiar objectives are stated below

- To explicate the demographic characteristics of Microfinance program beneficiaries.
- To assess the significance and impacts of MFI programs on beneficiaries' social and economic conditions in terms of employment generation, savings, and income.
- To analyze the significance and impact of MFI programs on the social status of beneficiaries through decision-making, living standards, and expenditure.

The study relies on Secondary data. The sample comprises around 150 beneficiaries of the chosen MFI, selected from the local branches in Madhya Pradesh from the period of 1st February 2022 to October 30. Data collection is the tool used to gather information from the respondents based on a specific subject that is taken for research.
Data were collected from 2022 February to October 2022 in the local MFI branches of Credit Access Grameen Limited, ESAF Microfinance & investment, and Fusion Micro Finance. Undisguised, standardized research instruments were framed on secondary data based on five points on a Likert scale having a rating scale such as 1, 2, 3, 4, and 5 denoting strongly disagree, disagree, neutral, agree, and strongly agree, respectively. This scale is utilized for measuring the socio-economic status of the beneficiaries in the MFI local branches. The respondents of the study are the general beneficiaries, taken for survey assessment. The Microfinancial services information

gained by beneficiaries is collected as the secondary data in the study. Other statistical outcomes are collected from the other MFI websites as well. The statistical assessment employed on secondary data draws out conclusions and inferences by using (the SPSS) statistical package for social sciences. The respondents were assessed twice by the research objectives, the prior period before they took up the facilities of Microfinance and the post period after they availed the services of Microfinance, such as loan facilities, credit expenses, finance availability for business start-up of the privileged people or the population availing for their financial stability for their societal and economic status.

By adopting a random sampling strategy, the total data gathered from the selected participants is 150. After collecting the data, it is fed as different variables and assessed through the tool called SPSS to accomplish the aim of the research. Thus, the valuable respondents for the survey were 150 which were filtered using random sampling methods for their perceptions, regarding the benefits availed by the participants, and challenges faced by the population during the accessibility of micro-finance services. Similarly the socio-economic factors before availing of the MFI services as well as after the MFI services were analysed using a semi-structured questionnaire.

The samples of the research constitute the general public who require as well as attain MFI services. The technique used to fetch out the responses is the random sampling technique. The random sampling technique is defined as a sampling process that allows for randomization in the selection of samples. Every sample possesses the same probability as other research samples to be chosen serving as a representation of the whole population. For assessing data from participants, who have not acquired MFI services, a random sampling technique is proceeded.

The research instrument has been denoted as a tool that has been utilized to measure, analyze, and collect data based on the proposed research interests. These tools have been frequently utilized in the education, social sciences, and health sciences sectors to examine the students, clients, and patients. The proposed research has used a semi-structured questionnaire retrieved from primary data sources. This tool of semi-structured questionnaires with closed-ended questions has a fixed level of responses to every question.

The secondary data sources employ a standard structured questionnaire as the research instrument for the study. The research assesses the demographic profile of beneficiaries and the impact of MFI programs on beneficiaries' economic conditions and social status. The statistical assessment employed on secondary data draws out conclusions and inferences by using (the SPSS) statistical package for social sciences.

Quantitative research analysis (Jung, 2019) is determined as a systematic phenomenon by collecting data and executing mathematical, statistical, and

computational methods. The quantitative method fetches data from conventional and prospective customers utilizing sampling techniques and providing online research, polls, and surveys, the results are determined in numerical terms. After careful interpretation, these numerals are used to predict or evaluate the future of the research and make the necessary changes.

With the support of a framed questionnaire, the data are collected from the particular sample respondents, and quantitative methodology is utilized for the data analysis. The data will be recorded using an Excel sheet to reveal the variables. The software tool SPSS is used for the subsequent estimation stage to analyze the variables entered in Microsoft Excel. The outcomes are estimated using five evaluation approaches. The statistical assessment is explicated through exploratory data analysis, regression test, and ANOVA test. ANOVA is a statistical tool and it is used to find the difference between the means of two independent collections by the analysts. Frequency distributions are defined as the visual displays that form frequency counts and this helps the information be concluded simply.

The implications are performed based on the results of the study and further enhancement is suggested for the implementation of the research in the future. The usage of SPSS software in this research makes the results to be effective and consistent in counting the values. The collected data was enumerated with the usage of Excel and SPSS software. Regression and ANOVA are accomplished to evaluate the organized hypothesis. The data estimation comprises 3 levels namely,

- Microsoft Excel is used to incline the demographic variables, and the design of frequency distribution is done.
- To list the data that are analyzed by statistics to predict the median range, and the mean standard deviation of several variables in this research is a significant step. Hence SPSS software is employed in this research.
- Regression, ANOVA, and Correlation evaluation are employed to evaluate the research hypothesis.

Certain ethics will be followed while conducting the research analysis. As the study is based on the individual perceptions of women regarding online flaming behavior, causes, prevention, mitigation ways, the role of online platforms, and their psychological effects it poses, the research deals with highly confidentiality-based responses. The following ethics are followed:

- Before the researcher's survey assessment, information is passed to the respondents in the prior stage.
- The respondents are not forced by any means to give their responses. Only willing respondents are selected for the survey analysis.
- Only the responses to the questionnaire are asked of the respondents, their private reports or data are not forced to be exposed by them.

- Since the research study uses only original data for data analysis, it doesn't contain any false data.
- All the data organized and gathered would be kept highly confidential.

These are the ethical considerations used by the researcher for the research analysis, which are accurate to their knowledge based upon this research study.

4. Results and Discussion

This section presents the results and the related discussions of the collected secondary data. The demographic details and impact of MFI on the economic and social conditions of the beneficiaries are presented below.

4.1 Beneficiaries' Demographic Details

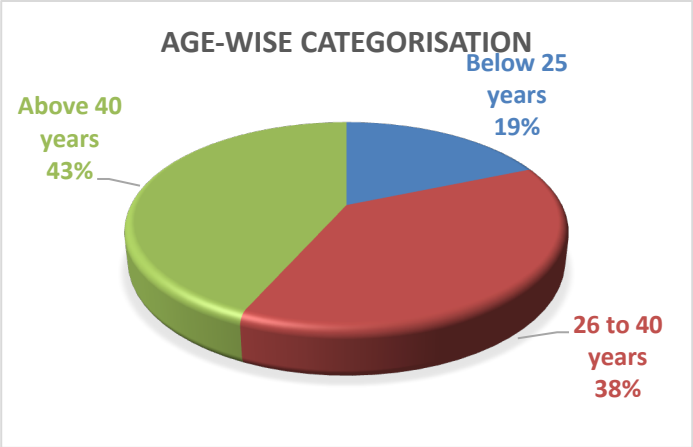

Figure 2. Age Distribution
Source: Own processing

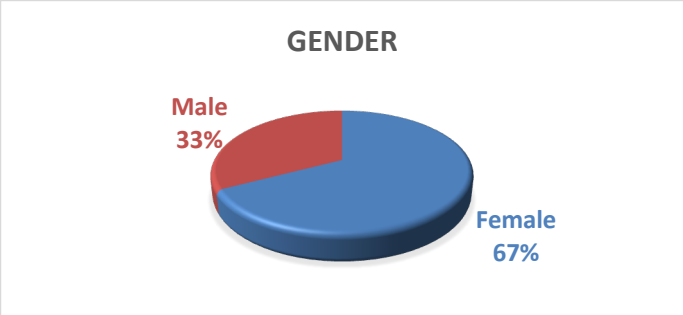

Figure 3. Gender Distribution
Source: Own processing

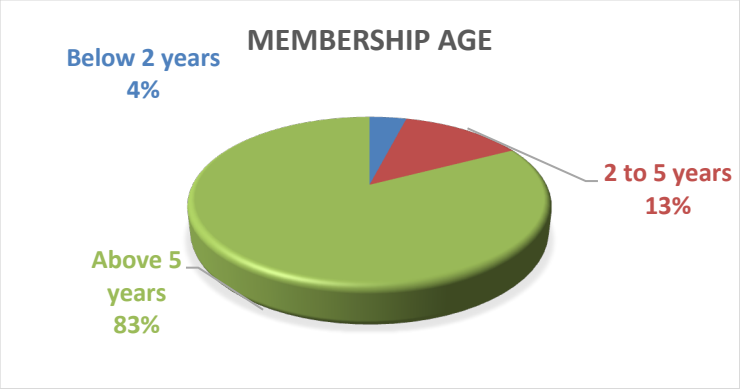

Figure 4. Membership Age
Source: Own processing

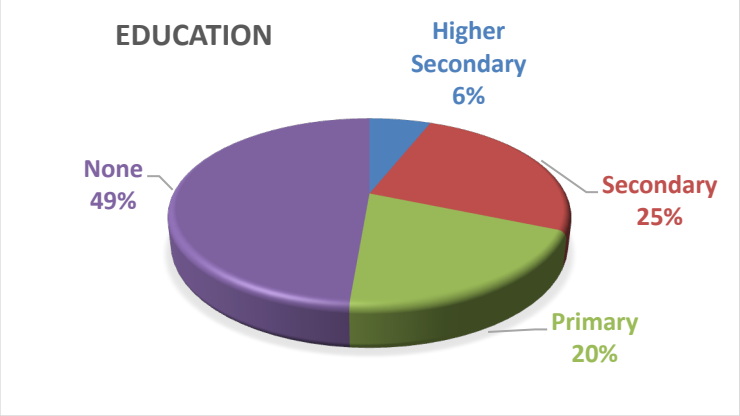

Figure 5. Educational Details
Source: Own processing

The above figures 2, 3, 4, and 5 show that 43% of the beneficiaries are above 40 years of age and 67% of the beneficiaries are female while it can be seen that 38% of the beneficiaries are around 26 to 40 years of age. It is also evident that 25% of the beneficiaries possess an educational qualification of below secondary education with more population having no education background, are in a situation of availing MFI services. Also, only a meager proportion of 6% of the beneficiaries have completed higher secondary education. While the membership age details show that 83% of the beneficiaries have a membership of 5 years and above with the MFIs. These inferences imply that the female population possesses more interest in MFI,

to avail the benefits for livelihood uplift. The population who are more than 40 years of age, with more experience and demands and commitment in life pose their opinion to opt towards MFI services, implied by 43% of respondents' target population.

4.2 Impacts of the Microfinance Programs on the Beneficiaries' Economic Conditions

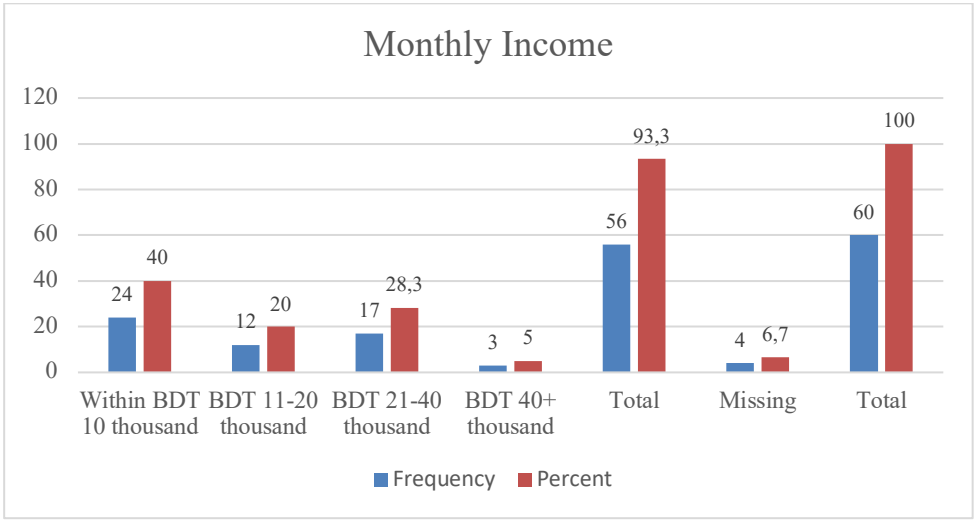

Figure 6. Monthly Income of the Beneficiaries
Source: Own processing

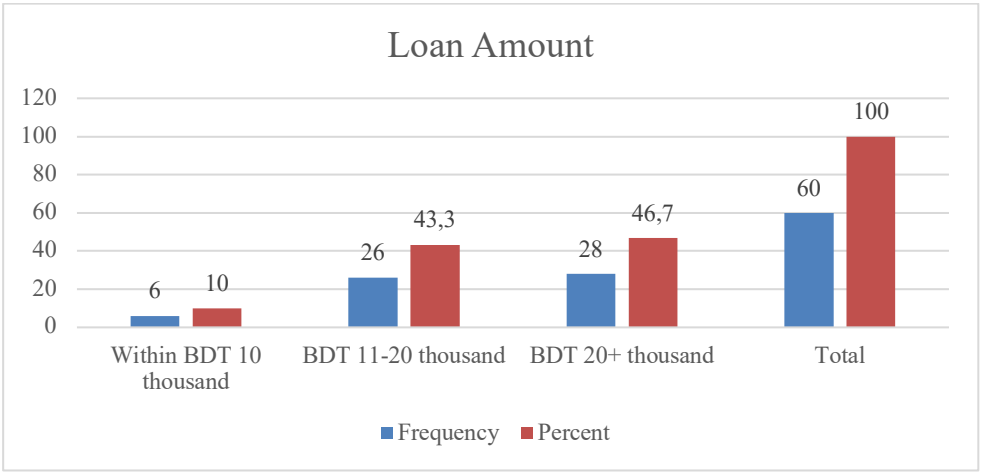

Figure 7. Amount of Loan Received by the Beneficiaries
Source: Own processing

From the above figure 6, it can be seen that the majority of the beneficiaries have a monthly income of less than BDT 10,000. Figure 7 depicts the loan amounts granted to the beneficiaries by the MFIs. It can be observed that more than 90% of the beneficiaries received an amount greater than BDT 10,000. The economic conditions and societal impacts of the population by the services of MFI were calculated for 100 respondents, by the excluded population of the control group, who have not yet availed of the MFI services.

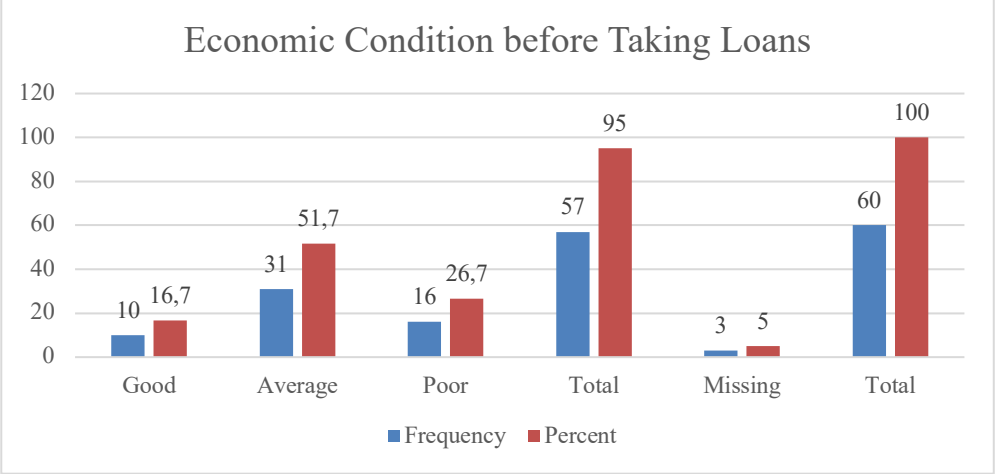

Figure 8. Economic Conditions before availing loans
Source: Own processing

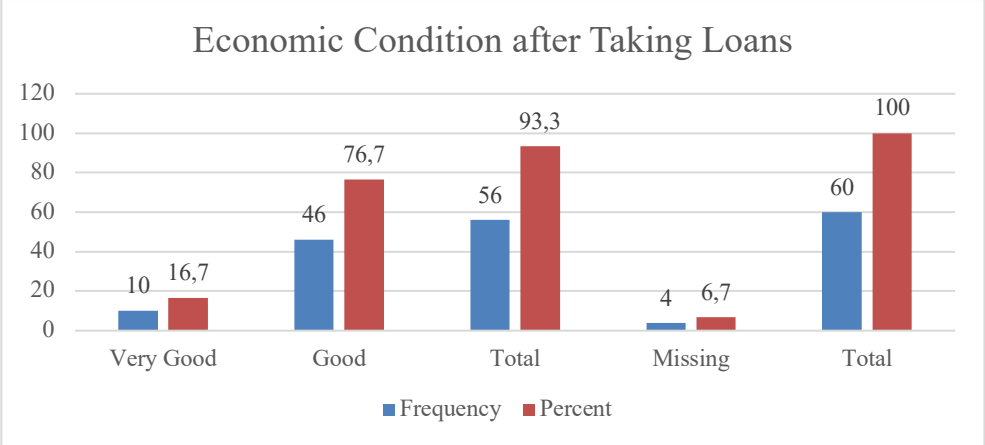

Figure 9. Economic Conditions after availing loans
Source: Own processing

Figures 8 and 9 show the beneficiaries' economic conditions before availing of loans and after receiving them. It can be noticed that the count of beneficiaries in good economic condition increased and 10 of them have moved from good economic condition to very good condition. Hence this shows that Microfinance programs have a constructive impact on economic conditions.

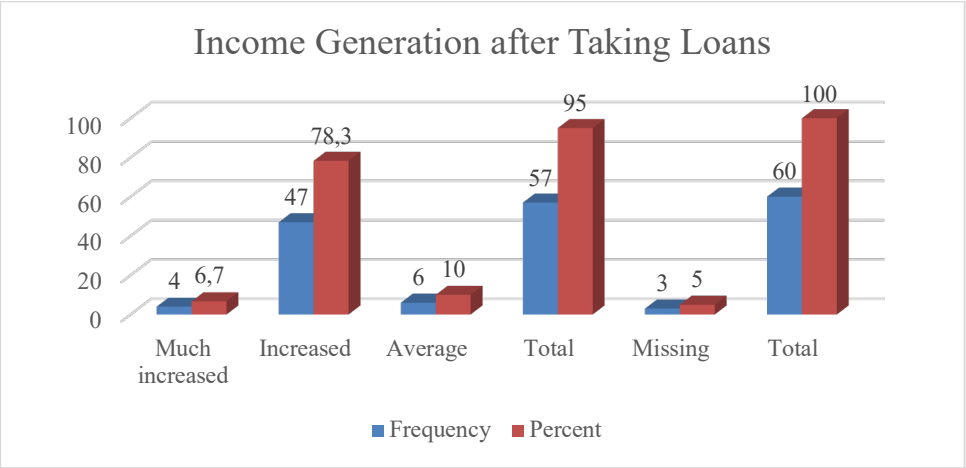

Figure 10. Generation of income after loan
Source: Own processing

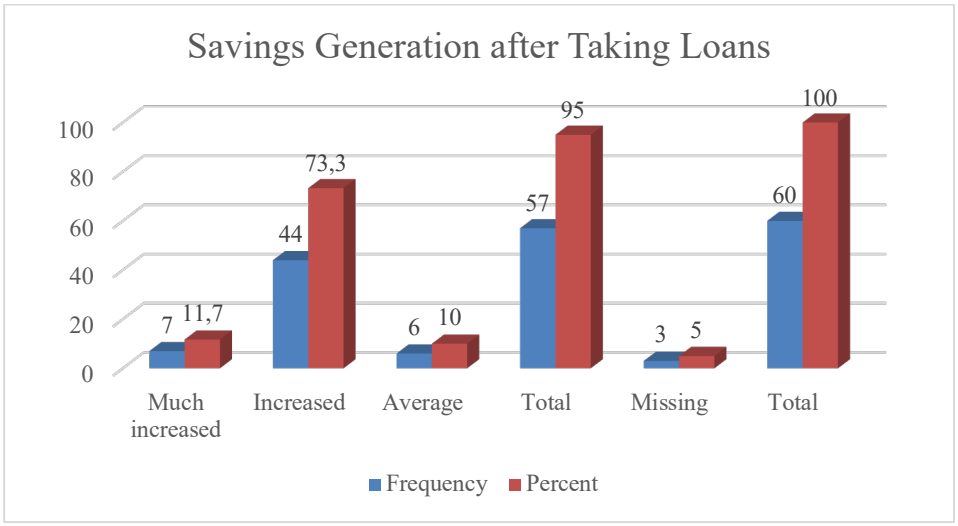

Figure 11. Generation of savings after loan
Source: Own processing

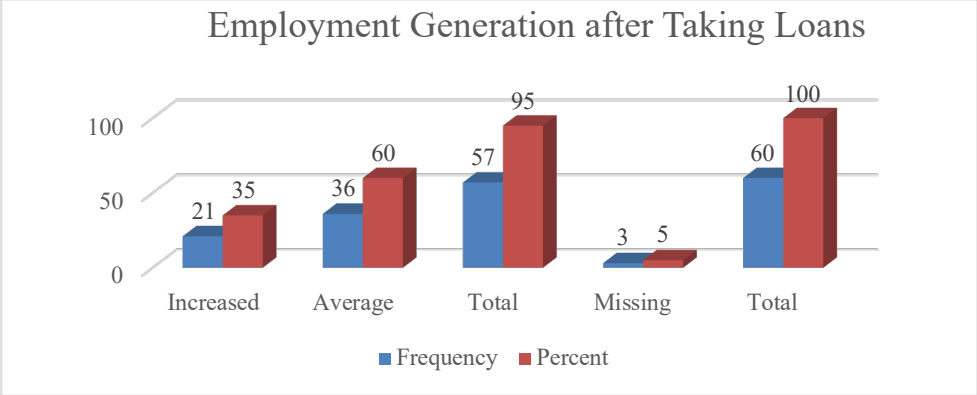

Figure 12. Generation of Employment after Loan
Source: Own processing

The above figures 8, 9, 10, 11, and 12 depict that the level of income and savings significantly increased with the microfinance programs. The savings and income have been found to increase to 85.6% and 89.5% respectively. While figure 8 shows that almost 35% of the beneficiaries' employment chances have surged.

4.3 Impacts of the Microfinance programs on the Beneficiaries' Social condition

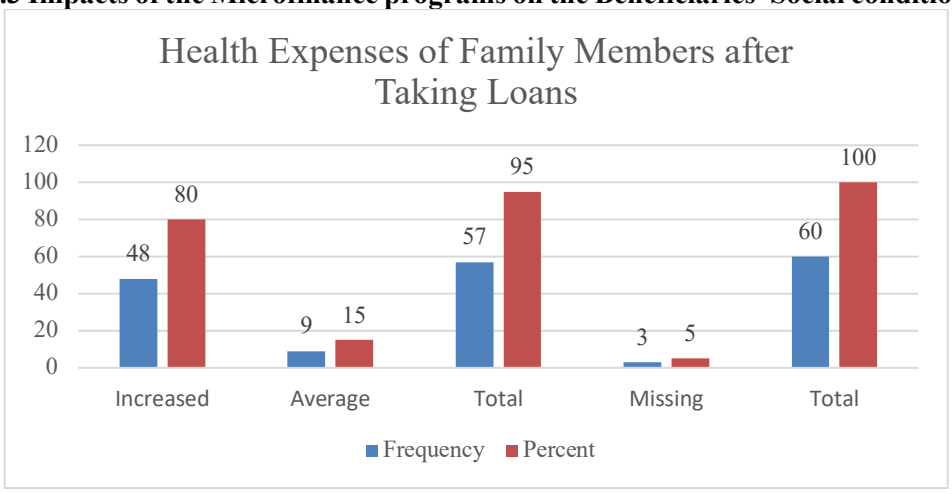

Figure 13. Health Expenses after Loan
Source: Own processing

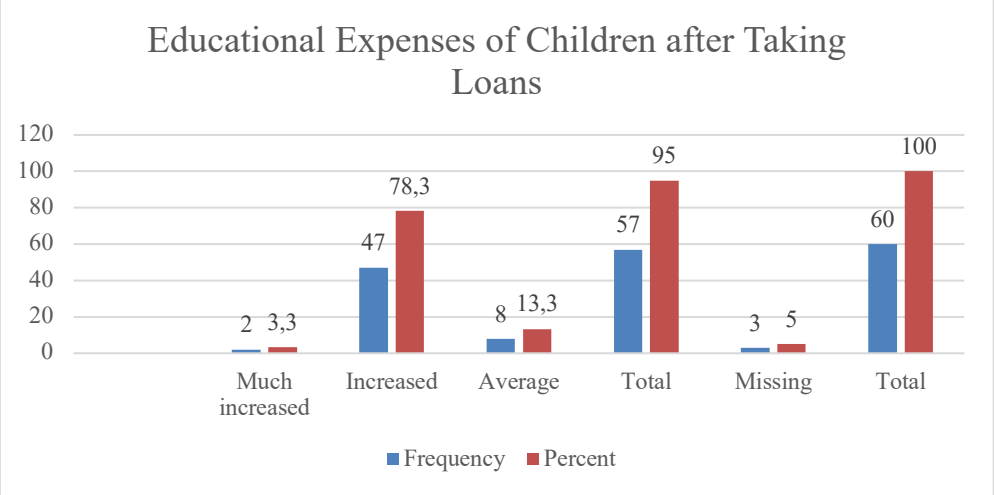

Figure 14. Educational Expenses after Loan
Source: Own processing

The above figures 13 and 14 show that health, as well as educational expenses, increased, which means that the solvency has grown and an upsurge in the expenditure paves the way to better living standards.

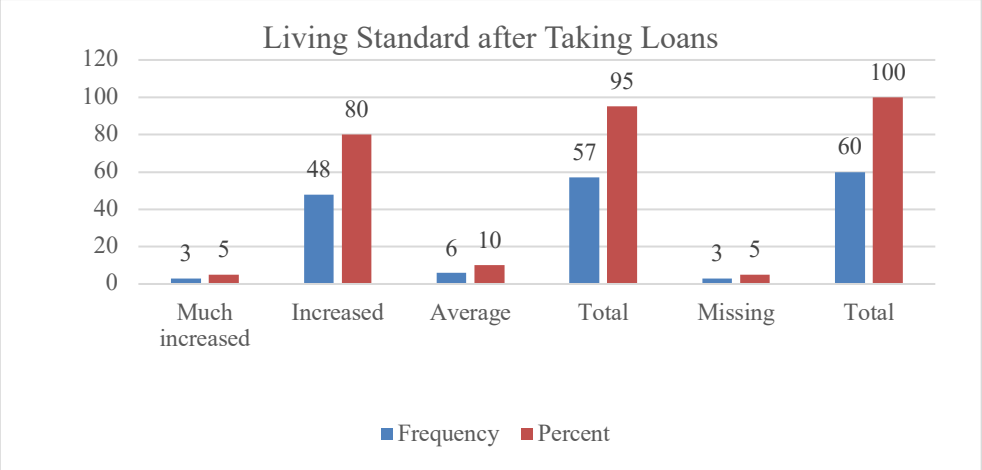

Figure 15. Living Standards after Loan
Source: Own processing

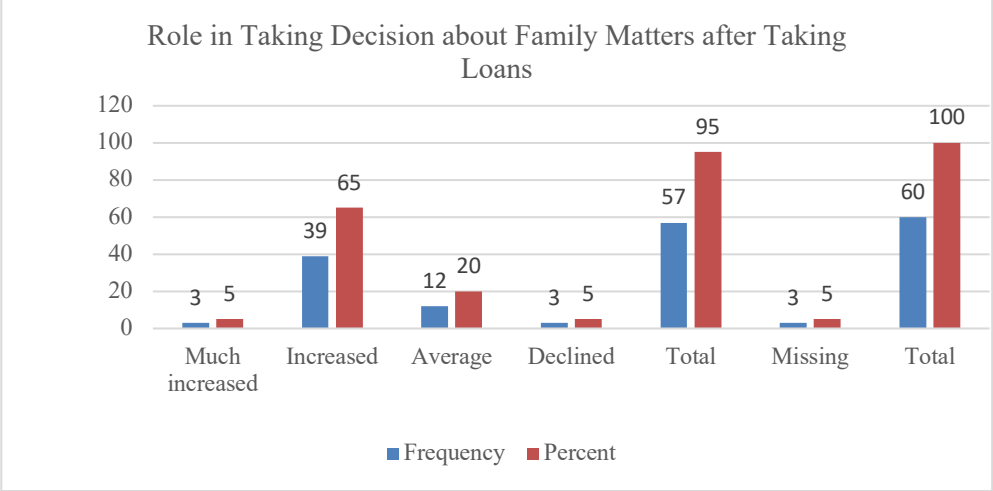

Figure 16. Decision taking after loan
Source: Own processing

The above figures 13-16 show that almost 89.5% of the beneficiaries' living standards have been increased with the microfinance programs and figure 16 shows that the beneficiaries' role in decision-making has momentously increased to 73.7%. It resulted in the elevation of saving and expenditure as the microfinance programs have the ability to generate income. The microfinance service holders get the opportunity to spend more for their children than before. In addition to this, the expenses for health are also found to be increased but the decision-making has marginally increased.

4.4 Analysing Socio-Economic Impact by Simple Linear Regression Analysis

The models that are utilized to analyze the socio-economic microfinance impacts are stated below.

$$IGV = \alpha + \beta.MA \quad \text{-- (1)}$$
$$SGV = \alpha + \beta.MA \quad \text{-- (2)}$$
$$ECV = \alpha + \beta.MA \quad \text{-- (3)}$$
$$SGV = \alpha + \beta.IG \quad \text{-- (4)}$$
$$CEV = \alpha + \beta.IG \quad \text{-- (5)}$$
$$LSV = \alpha + \beta.IG \quad \text{-- (6)}$$
$$LS = \alpha + \beta.MI \quad \text{-- (7)}$$

Wherein α represents the constant, β denotes the independent variables co-efficient, the Income generation variable is denoted by IGV, the Economic-condition variable

is represented by ECV, MI implies Monthly-income, age of membership pointed by MA, CEV represents the employment creation variable, living standard variable denoted by LSV and savings generation represented by SVG.

IGV – Income generation variable - There is an increment of profit in income after the intervention of Microfinance, by organizing your own business.

CEV - Creation of employment – The loan facility available through MFI allows you to commence new business in your locality providing better employment.

Monthly Income- MI – Does it result in an increment of the monthly income, in comparison to the previous period before 2 to 3 months?

MA – Membership age – There is a consideration in the membership age have you come forward to invest in Microfinance Investment or loan availability for your business?

LSV- Living standard variable - The living standards of the people in terms of income generation in the business, daily wage profit, and societal perception of you and your family have been improvised.

SGV- Savings generation variable – The family savings for your personal needs and the family expenses are improvised after the financial stability through microfinance facilities.

Table 1. Co-efficient Table

Source: Own processing

Tables 1, 2, and 3 describe the coefficients of the study's independent variables, the Model summaries table, and the analysis of variances table, which are found significant. In the first, second, and third models, it has been depicted that more membership age in MFI, in parallel there occurs more probability for income generation, better economic, and more savings generation. The fourth, fifth, and sixth models, revealed that the MFI income generation variable resulted in high employment creation, more savings, and better standards of beneficiaries living. The seventh model enumerated that if there is a high monthly income, there will be a better living standard.

In an elaborative manner, the models defined that if the beneficiary's age from MFI is increased by 1 percent, then there will be an increase of income generation by 26 percent, a 56% increase observed in savings. Similarly, there will be better economic conditions as well, with an increase of 41 percent. Likewise, if there is a maximization of income generation by 1%, there will be a simultaneous increase in employment creation (48%), an increase in savings generation (71%), and paves to better living standards to a 29% increase than the previous one. If the parameter monthly income increases by 1%, then the living standards of the beneficiary would be better by comparing to the prior stage by 13 percentage.

Table 2. Model-Summary

Models	R	R Square	AdjustedR square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.345	.121	.103	.398	.121	7.476	1	55	.007
	Predictors: (Constant), MA, Dependent Variable: IG								
2	.644	.415	.404	.370	.415	39.110	1	55	.000
	Predictors: (Constant), MA, Dependent Variable: SG								
3	.598	.357	.346	.311	.357	30.721	1	55	.002
	Predictors: (Constant), MA, Dependent Variable: EC								
4	.621	.383	.372	.380	.384	34.273	1	55	.001
	Predictors: (Constant), IG, Dependent Variable: SG								
5	.412	.171	.154	.446	.171	11.293	1	55	.001
	Predictors: (Constant), IG, Dependent Variable: CE								
6	.308	.094	.078	.380	.094	5.802	1	55	.018

	tors: (Constant), MI, Dependent Variable: LS								

Source: Own processing

From inference of the above table, it could be depicted that the p-value of t-statistics, for all the independent-variable, co-efficient was less than 0.05, which implies that all independent variables of the study possess a significant effect on the dependent variables, of corresponding respective models.

Table 3. ANOVA Table

Models		Sum of Squares	df	Mean-Square	F-Value	Sig.

Source: Own processing

Tables 2 and 3 define the model's fitness test. It is implied from the ANOVA table in Table 3, that the F-statistics p-value for all the models is less than 0.05. This low significance value indicates that all the models were significant at a 5 percent significance level.

From the outcomes of the models, it is seen that the programs of MFI were playing a significant role in savings generation and income that are statistically significant. Hence, it reveals the social impact of MFI on the beneficiaries. The results, clearly show that holders of Microfinance services could see a gradual increase in their living standards day by day. The MFI programs, aid in generating more and more employment opportunities, and hence the expansion of better economic conditions emerges significantly. These MFI were offering training programs for those service-holders as well as various other financial services except lending activities such as financing, to open DPS accounts for micro-enterprise development it offers educational loans, life-insurance programs, scholarships, and better medical and health facilities.

The results of this study are comparable with the previous studies (Shafique & Khan, 2020), (Roy & Mohanty, 2020), (Al-Amin & Mamun, 2022) and (T. A. Khan, Khan, Violinda, Aasir, & Jian, 2020). The study (Shafique & Khan, 2020) proves that the micro-credit providing schemes have improved the socio-economic conditions of small agriculturists in Pakistan. The study (Roy & Mohanty, 2020) proves that MFIs can improve the educational attainment, life expectancy, and ability of income generation in India. The study (Al-Amin & Mamun, 2022) has proved the impact of MFIs in improving the living status of the beneficiaries in Balunnaghar, Bangladesh. The study (T. A. Khan et al., 2020) reveals the potential of MFIs for transforming women entrepreneurs to be financially stable in society.

5. Conclusions

With the popularity of Microfinance, it had traversed an empirical study with a quantitative approach and exposed it as one of the prominent instruments in enhancing the socio-economic development of the people. Analysis of quantitative information from the MFI of Jabalpur led to a significant conclusion for comprehending the social and economic development of beneficiaries through their MFI services. As per the statistical outcomes, microfinance programs have significant and prominent impacts among the beneficiaries of MFI services, to alleviate poverty and in the generation of savings and income. MFI programs support promoting employment to a certain extent, in Jabalpur district in Madhya Pradesh, yet it is not still a satisfactory approach. The consumptions and savings of MFI service-holders who are all the beneficiaries of Fusion MFI, Credit Access Grameen, and ESAF MFI, tend to increase and they attain better living standards. Hence, the Microfinance programs, ought to be accelerated more, to attain social development

outcomes, and to uplift the economic status of the service-holders. Above all, with the esteemed role of Microfinance services to unprivileged people, poverty eradication could be accomplished in developing countries, promoting their social standards. The study implication states that Microfinance programs play a vital contribution to enhancing the socio-economic condition of the beneficiaries. The results insist that the government should frame necessary policies, and encourage poor people to utilize micro-finance services. There prevails a distinctive opportunity to organize large-scale research in this field with appropriate resources and time, wherein determines a pathway to explore more financial backing schemes by Micro-finance institutions and the Government as well.

Though this study provides valuable insights into the impact of MFIs in improving the socioeconomic status of the beneficiaries, this study has certain limitations. This study has considered less number of respondents. This may reduce the dependability of the results. This study results are associated with the specific location of Jabalpur (Madhya Pradesh). This renders the generalized comparability of the results with other geographic locations. Future studies should be conducted with a larger study population and broader geographical location to overcome the limitations of this study.

A STUDY OF PREFERENCE OF YOUTH TOWARDS ATTRIBUTES OF CLOTHING IN SAURASHTRA REGION

Mr. Paras M. Parmar
Research Scholar, Saurashtra University, Rajkot
parasmparmar154@gmail.com

Dr. Harish M. Shah
PhD Guide, Ex. Principal, K.K Parekh Commerce College, Amreli (Saurashtra University)

Abstract
The Research study is done with the objective of systematically knowing the preference of youth towards attributes of clothing in Saurashtra Region, Gujarat. For the sake of collecting responses the method of sampling is used in this research paper is random sampling technique. The collected data has been analyzed with the help of SPSS statistical tool. The result found in this research is descriptive in nature and were presented using percentage distribution method and with the pie charts, graphical presentation. As per data collected for the purpose of research, the respondent's age range is from 17 to 40 years and out of that 53% were male and 47% female from different race and religion whose average monthly income were Rs. 25000 to 30000. The research survey shows that 75% were unmarried and 25% were marriedand about 26% respondents making choice by their own and rest 34% were influenced by their Family and 40% were influenced by their friend circle. Respondent's preference towards Styles of clothing that were unique at Saurashtra region which includedjeans trousers, hipsters, denim jeans, skirts and jackets,tiered skirts, hot pants and skirts etc.
The literature review of earlier research concludes that majority people were not well aware about attributes of clothing and textile industry. Hence,thetrendat Saurashtra region seemedtosuggestthatmanyofthemdidnotknowhowto select appropriate clothing which is suiting their figure types and for the variety of occasion.This research study therefore made to find out attributed thatinfluencedtheclothingselectionoftherespondents of Saurashtra Region.Factors towards attribute of selection of clothing that influenced the respondents are fitting, Quality, Uniqueness, Colors, Availability, Style and Current fashion, Durability, Variety, Price and Status symbol.Therespondentssuggestedthatthepeople should be well are about basic knowledge for right choice of clothing to enable them to make informed clothingdecisionsinlife.
Keywords:Clothing,Fashion,Apparels,Style, Trend.

1.Introduction

Various theories have persuaded to explain the basic motivations behind clothing for human beings to cover the body. Majorly Modesty, Protectionandadornmentarethe threekey theories which explain logicsbehindthewearingofclothes.However there are some point of disagreement among various theorists.A research study ofmotivations towards clothingcould assist one to understand the dressing behavior of people.
The first theory found about clothing was the biblical one of modesty, that explain that clothes were worn to cover nakedness andbecause of sort of shame. Howeverthis theory was disputed by researchers on the grounds thatmodesty is not the same indifferent cultures. It has been updated like apart of the body covered by those in one specific culture may be left exposed or opened without any shame bythose

in a different culture. The secondtheory explains about the origin of clothes is the opposite of the first theory. According to the second theory, clothing werefirst worn to call attention to the parts of the body covered. A third theory states that man first wore clothes as toprotection against the elements of insects, beasts and enemies or against harm or supernatural forces. The fourthand final theory of the origin of clothing is that it was one means of aesthetic expression. This theory has beencalled thedecorationorornamentationtheory.

2. Literature Review

According to theory and research of Ryan(1966) and Dearborn (1980) as having stated like clothing protectsus from varioustypesoffear,theestimationof poverty,theestimation of inefficiency, bodily internal discomfort, anxiety, estimation of lack of self-respect, estimation of lack of good taste towards clothing etc.

Accordingto the research study of Frings(1991)buyingmotives is not same for all consumers, itvaryfromconsumertoconsumerandfromdaytoday.Every human being do have some desire to be fashionable, attractive, impress others, be accepted by friends, peer groups orcolleagues and fulfill an emotional need- new clothes often give a feeling of security and confidence.
In his view,criteria used by consumers for Selection of fashion clothing include: color which is usually the first aspect of a garment and other attributes like fitting, Quality, Uniqueness, Availability, Style and Current fashion, Durability, Variety, Price and Status symbol etc. are playing very important role in buying behavior.

Practical considerations with reference to attributes of clothing include: Price- Means theconsumerevaluates the totalworthof Clothing. Fitting- the try-on is a crucial step in consumer selection of agarment. Comfort- to keep the wearer at ease, warm or cool. Appropriateness – suitability or acceptability for aspecific occasion or need, fabric performance, care and workmanship - quality of construction, stitching, orfinishing.

As there will be always a research gap about selection of clothing and Attributes of clothing as the fashion change process consists of several stages including change in clothing and appearance ofstyles, introduction new ways of wearing and style, acceptance and decline.

3.0 ResearchMethodology

3.1 ResearchDesign

In this research study basically two technique of research designs were used; First one is quantitative technique which usednumbers in describing observation of materials or characteristics rather than words and the qualitative techniquewhichusedwordsandpicturesmorethannumbers

3.2 PopulationoftheStudy

A population is a particular Saurashtra region, Were 12 districts are there and a sample size is a smallergroup selected from a larger group or population. Out of the total population of youth asample size of 394 was used to undertake the study. The population of this study was all youth belong to various districts of Saurashtra Region.

The proportionate random sampling technique was used to select the respondents from the 12 districts of Saurashtra Region.Thistechniquemadeit possibleto selectarepresentativenumber ofrespondents for thestudy.

3.3 DataCollectionTechnique

A well-structured questionnaire is used with a series of written questions on a attributes of clothing about which a respondent's opinion issought and it could be open or close ended and many questions was with check box. In this research study, for the sake of data collection from respondent both the type of questions were used that is open-ended and close-ended. It has been found that all the respondents were literate, the questionnaire was self-administered by respondents to savetime, Energy and tomakeanalysiseasier.

4. FindingsandDiscussion

Table 1:GenderofRespondents

Gender	Numbers	% (Percentage)
Male	211	54
Female	183	46
Other	0	0
Total	394	100

Table-1 Shows that the respondents were made up of 53% (211) males and 47% (183) females. New trend of Fashion changesamong females was more rapid at Saurashtra Region than that of their male counterparts. As the data says there will more chances of changing preference towards attributes of clothing are more in females as compare to males, It is found that males usually does not change preference towards attributes of clothing.

Table2:AgeDistributionofRespondents

Age in years	Numbers	% (Percentage)
17-22	191	48
22-27	120	30
27-32	60	15
32-37	13	4
37-42	10	3
Total	394	100

Table-2 Depicts the age distribution of the respondents. The age distribution of the respondents was from the agerange of 1-22 years. There were 191 respondents in that age range making 48% of the sample. In the agerange of 22-27 years there were 120 respondents in that age range making 30% of the sample. In the agerange of 27-32 years there were 60 respondents in that age range making 15% of the sample. In the agerange of 32-37 years there were 13 respondents in that age range making 4% of the sample. In the agerange of 37-42 years there were 10 respondents in that age range making 3% of the

sample. This wasbecause the age range expected of majority of youth was in that range. It is very clear from the above mentioned data that major age group with reference to selection of clothing are belong to age group of 17-22.

Table3: Reference group affecting in selection of Clothing

Reference group	Numbers	% (Percentage)
Family Members	136	34
Friends	140	36
Colleagues	17	4
Neighbor	4	1
None (Alone/Self)	97	25
Total	394	100

Table-3 As per the collected data it has been found that 136 (34%) of the respondents made buying decision with the Influence of their family members, 140 (36%) of the respondents with the influence of their friend circle, 97 (25%) of the respondents make buying decision by their own clothing choices, 17 (4%) of the respondents made buying decision with the Influence of their Colleagues and 4 (1%) of the respondents made buying decision with the Influence of their Neighbor. It has been found that as far as the influence of selection of clothing is concerned, Friend circle do have maximum influence and then after Family members.

Table 4: Preference toward Fitting Attribute

Fitting Attribute	Numbers	% (Percentage)
Tight	23	6
Loose	19	5
Comfortable	352	89
Total	394	100

Table-4 With reference to Preference of fitting attribute in selection of clothing, As per the response of respondent it has been found that out of total sample size 23 (6%) do prefer clothing with Tight fitting, 19 (5%) do prefer clothing with loose fitting and Majority i.e 352 (89%) respondent do like clothing with confirmable fitting. From the above statistics it has been very clear that majority of sample size will be preference towards attributes if clothing which give a feel of comfort and then may be of tight fitting.

Table 5: Preference toward Quality Attribute

Quality Attribute	Numbers	% (Percentage)
Very High	131	34
Moderately high	153	39
Good	107	27
Total	394	100

Table-5 shows the percentage of respondent with reference to Preference toward Quality Attribute, According to data collected it has been found that out of total population selected 131 (34) people do

prefer clothing with very high quality of material, 153 (39%) people do prefer clothing with moderately high quality of material and 107 (27%) respondent do prefer clothing with good quality only. It has been proven from the above data that 39% who is majority do prefer clothing with moderately high quality.

Table 6: Preference toward Uniqueness Attribute

Uniqueness Attribute	Numbers	% (Percentage)
Always Required	148	38
Generally Required	191	48
Not Necessary	55	14
Total	394	100

Table-6 Explain about preference towards Uniqueness attribute in buying of clothing, On the ground of data collected it reveal interpretation like 148 (37%) respondent do required uniqueness in clothing always, 191 (48%) which is major part of respondent do expect uniqueness not always but Generally is expected, 55 (14%) Respondent said it not required to have uniqueness in clothing. As per data we can conclude that majority of people do observe uniqueness in clothing.

Table 7: Preference toward Color Attribute

Uniqueness Attribute	Numbers	% (Percentage)
Same Color	30	8
Contrast	182	46
Mix & Match	182	46
Total	394	100

Table-7 Shows preference of people towards color attribute in selection of clothing, As per the review of respondent it is found that as far as the color attributes is concerned 30 (8%) do prefer clothing with same color whereas 182 (46%) respondent do prefer clothing with the attribute of contras, Equally 182 (46%) respondent has given their opinion like they do prefer clothing with Mix & Match attribute.

Table 8: Preference toward Availability Attribute

Availability Attribute	Numbers	% (Percentage)
Everywhere	188	48
At Selected Places only	206	52
Total	394	100

Table-8 Flashing light on what is the preference of youth of Saurashtra Region about Availability attribute, from the data collected, It has been found that 188 (48%) people do find clothing as per their need and requirement at every apparel store and on the other hand it is like 206 (52%) population said like they do not get availability of preferred clothing at all the apparel shops but at Selected places only. The above shows that it will be difficult to find apparel as per preference at every apparel shop and Respondent will be in need to visit selected and specific apparel store only.

Table 9: Preference toward Style and Current fashion Attribute

Style and Current fashion Attribute	Numbers	% (Percentage)
Highly Fashionable	217	55
Classical	115	29
Comfortable	62	16
Total	394	100

Table-9 Explain about Preference toward Style and Current fashion Attribute in decision making process of clothing. As the data say that 217 (55%) respondent do expect and give preference toward selection of clothing as on the basis of highly Fashionable Clothing, On the other hand is has been found that out of total samples size 115 (29%) people do prefer clothing with classical look (Style) which is not changing rapidly, 62 (16%) respondent share their views like they prefer clothing which provides Comfort to them.

Table10: Preference toward DurabilityAttribute

DurabilityAttribute	Numbers	% (Percentage)
Less than 1 Year	60	16
1-4 Years	309	78
5-8 Years	19	5
More than 8 Years	6	1
Total	394	100

Table-10 is all about preference of people toward the durability attributes in the buying process of clothing. Collected data is very clearly defining that 60 (16%) respondent from Saurashtra Region do give preference towards clothing which durable for less than 1 years, Majority i.e. 309 (78%) respondent given their consent like they give preference in selection of clothing which is providing durability of 1 to 4 years. Rest 19 (5%) and 6 (1%) respondent shared their response like they prefer clothing with durability of 5 to 8 years and More than 8 years respectively. Means majority of population do prefer clothing with durability of 1 to 4 years.

Table 11: Preference toward Variety Attribute

Variety Attribute	Numbers	% (Percentage)
Wide	164	42
Moderate	191	48
Limited	39	10
Total	394	100

Table-11 Explain about preference of youth towards variety attribute in selection of clothing. With the help of data generated on the primary bases, we can say that 164 (42%) respondent do prefer clothing with wide range of variety, on the other side 191 (48%) which is majority of population says that they

do prefer clothing were moderate varieties are available and 39 (10%) respondent shared their opinion like they prefer clothing with limited variety and Edition.

Table 12: Preference toward Price Attribute

Price Attribute	Numbers	% (Percentage)
Designer (More the Rs.2000)	121	31
Better (Rs.1000)	231	59
Moderate (Rs.500)	36	9
Budget (Rs.300)	6	1
Total	394	100

Table-12 Shows responses of population about preference towards price attribute, It has been found from the collected data that 121 (31%) of respondent do prefer designer clothing which is costing 2000 and more, 231 (59%) respondent says like they do prefer better clothing with cost of 1000, 36 (9%) people says that they do prefer clothing with moderate price i.e. Rs.500 and 6 (1%) shared their view like they prefer budget clothing which is costing them Rs.300 and below. It has been proven from the data above that, Majority of people do prefer clothing which is costing them around 1000 Rs.

Table 13: Preference toward Status SymbolAttribute

Status SymbolAttribute	Numbers	% (Percentage)
Sophisticated	121	31
Normal	231	59
Total	394	100

Table-13 At the last gives brief about people's opinion with reference to Status symbol attribute of clothing. From the data it can be interpreted like 121 (31%) respondent do prefer clothing which provides sophistication in look, on the other rest majority i.e. 231 (59%) people do prefer clothing with normal status symbol look.

5.0 Summary and Conclusion

5.1 Summary

The main objective of the research study was to know about preference towards attributes of clothing of youth of Saurashtra region. The proportionate random sampling method was used to select three hundred ninety four respondent from different district of Saurashtra Region, Well-structured questionnaire with both open question and close-ended questions was used in collecting primary data from population of Saurashtra Region. All questionnaire were retrieved and analyzed. The respondents comprised 211(54%) male and 183 (46%) femaleyouth.Theywereagedbetween17and42withmajoritywithin17to22.It has been found that as far as the influence of selection of clothing is concerned, Friend circle do have maximum influence and then after Family members.Majority of sample size has given preference towards attributes if clothing which

gives a feel of comfort and then may be of tight fitting.It has been proven from the data collected that 39% which is majority of respondent do prefer clothing with moderately high quality. As per data collection we can conclude that majority of people do observe uniqueness in clothing. Out of 394 respondent182 (46%) respondent has given their opinion like they do prefer clothing with Mix & Match attribute. As the opinion of respondent it will be difficult to find apparel as per preference at every apparel shop and Respondent will be in need to visit selected and specific apparel store only. From total respondent 217 (55%) respondent do expect and give preference toward selection of clothing as on the basis of highly Fashionable Clothing. Majority of population do prefer clothing with durability of 1 to 4 years. On the other side 191 (48%) which is majority of population says that they do prefer clothing were moderate varieties are available. 231 (59%) respondent says like they do prefer better clothing with cost of 1000Rs. On the other rest majority i.e. 231 (59%) people do prefer clothing with normal status symbol look.

ABSTRACT

The major focus of the research conducted is to evaluate the trends of developing a postgraduate program for social entrepreneurship in India's Higher Educational Institutions (HEIs). The researcher has performed an extensive search on the syllabi of social entrepreneurship from websites of HEIs in India focusing on the keywords on entrepreneurship, social entrepreneurship and social innovation. The studies identified that the curricular differences exist among various institutions were considered significant. To get better and deeper insights, the researcher has performed an analysis of the schools where these courses are being taught. Moreover, evaluation of course objectives, its contents, teaching pedagogies and strategies is conducted on entrepreneurship. Discussion on these offered insights has ignited an argument for the requirement of inter-disciplinary collaboration among social entrepreneurship educators.

INTRODUCTION

In today's contemporary society, there is an emergence of social enterprise which has been considered as responses to inabilities of the commercial and public sector in solving the social problem faced by the society which includes problems like unemployment, poverty and inadequate social services (Tam, 2017). Because Social Entrepreneurship (SE) is considered as an approach to resolve the social and societal problems through innovative solutions that ensure the sustainability of social value (Mort et.al, 2003). Further, this concept of SE is well-established in business vocabulary (Peredo & Mclean, 2006). The importance of SE is expanded to the level that it has made a place in the educational aspects of leading business schools with an essential matter of discussion at several academic and professional forums. But when it comes to the Indian context, SE has still not made appealing development and numerous reasons are supporting it. Considering the similarity between India and other developed nations based on their respective political background, India is just second largest democracy after the United States where the economic developed is backed up with such democratic setup (Khanna, 2007). The other essential feature is the fact where in the oldest market-based economies had no restrictions on private property rights. Presently, India is incredibly diverse having several religions, ethnic groups, cultures and languages spoken, English is still considered to be the business language. As per the statistics provided by Nasscom in 2015, India is just second to China in terms of the largest emerging economy and ranks third in global start up ecosystems. Also, India is second to China in terms of total population wherein India has more than 1.2 billion people (Census of India, 2011). With this high and increasing growth rate of population, there is an extreme demand for fulfilling social and environmental needs with restricted resources. Further aggravating the scenario, other social problems are emerging in India such as poverty, healthcare systems, education, lack of employment opportunities, hygiene and sanitation, water, and environmental issues. Considering the spread of poverty which is having a wider reach but not uniform distribution (Gore, 2003) there are a large number of social entrepreneurs emerged at a varied level to resolve the issue. They have come to function in a situation where all-state, market and third sector-have failed to overcome the social issues. The social entrepreneurs have utilized the existing resources and moulded into an innovative alternative to come up with sustainable and scalable solutions to the social problems thereby creating value to the beneficiaries.

Citation Information: Kumar, S., Kumar, P., Wisetsri, W., Raza, M. & Norabuena-Figueroa, R.P. (2021). Social entrepreneurship education: Insights from the indian higher educational courses. *Academy of Strategic Management Journal, 20*(S1).

Social entrepreneurs use both social mission and entrepreneurial skills to solve social problems. In India, there is no existing special legal framework for Social Enterprise (Singh, 2016). Indian social entrepreneurial ventures are considered as a means to deliver basic services and opportunities to the underdeveloped sectors like education, sanitation and healthcare facility to the weaker sector or underprivileged people of the society. There are some social enterprises are applying an innovative, cost-efficient and technology-driven business model to serve a vulnerable group of people and others are creating a supporting infrastructure to remove barriers that create a hurdle for social enterprise (Intellcap, 2012). The benefit from social enterprises in India is enormous owing to diversity and uncertainty of cultural aspects (Bornstein, 2007). According to the Asian Development Bank, 2018, in India, 21.9% of the population falls below the poverty line. To solve above problems, socially inclined citizens are required to collaborate for the formation of civil society (Lan et al., 2014) or individually, create a social enterprise to address the social problem in the affordable way (Mair & Noboa, 2006). For this purpose, social entrepreneurial education and training are required in a professional manner to create trained social entrepreneurs.

The entire paper is divided into seven major sections. The first section introduces the readers to the topic of social entrepreneurship, summarizes or discusses the relevant prior research and gives a brief understanding of the aspects to be covered in the coming section. The second section focuses on providing an overview of social entrepreneurship education in the Indian context. The third section discusses the data collection and analysis approach in analysing social entrepreneurship. Fourth and fifth sections cover the essence of the paper. It describes the curriculum and pedagogy of social entrepreneurship education in major Indian universities along with challenges faced in doing so. The sixth section describes the appropriate model of a curriculum for imparting social entrepreneurship in HEIs. And the final section provides the concluding remarks along with the future scope of research in this area.

Social Entrepreneurship

Bill Drayton was the first person to coin the term social entrepreneurship in 1980. At present, social entrepreneurship is gaining significant importance in the field of education that shows societal problem can be solved through innovation, value creation, sustainability and

Citation Information: Kumar, S., Kumar, P., Wisetsri, W., Raza, M. & Norabuena-Figueroa, R.P. (2021). Social entrepreneurship education: Insights from the indian higher educational courses. *Academy of Strategic Management Journal, 20*(S1).

outcomes associated with entrepreneurial efforts has emerged as a critical area (Austin, Stevenson & Wei-skillern, 2006). There are several studies conducted on social entrepreneurship, gave several definitions, concepts, theories and arguments (Seelos & Mair, 2004). Few researchers described social entrepreneurship as an established concept (Peredo & McLean, 2006) followed by others who believed in different schools of thought possessing reverse consent & belief for social entrepreneurship. Hence, the notion of social entrepreneurship has been debatable since the beginning of the last decade (Choi & Mazumdar 2014). On contrary, the third group noticed a lack in the process of social entrepreneurship. Being, a critical issue for researchers, social entrepreneurship has to be dealt with concrete knowledge and use of appropriate methodologies prevailing to the existing scenario. It is therefore useful for researchers to reach a consensus to describe the social entrepreneurship empirically. Viewpoint to social entrepreneurship varies concerning geography, culture & eco-system of the prevailing nation. Seelos & Mair defined social entrepreneurship that created social values through the innovative business model in the society followed by researchers who argued that social entrepreneurship must be included in creating economic and social values (Zahra et al., 2009). However, these researchers were unable to make a concrete and reasonable association of social entrepreneurship with economic and social outcomes. Also, a study by Choi and Majumdar argued that there is no scientific definition of social entrepreneurship in existing literature hence, emphasized developing more viable definitions on social entrepreneurship. In this regard, another group of researcher urged that scientific and social research community needed to be focused on areas to draw the attention of policymakers, development thinkers, and new entrepreneur to take initiation to develop a social venture in a region. However, social entrepreneurship can be regarded as a social activity that is performed by a social entrepreneur who has a particular social mission to identify and resolve a social problem. In the process of doing so, she utilizes an innovative strategy and sustains the business by bringing about social impact thereby ensuring sustainability and scalability (Hadad & Gauca, 2014). Definitions of social enterprise has been changing within the regions according to use, context and policy for social enterprise (Kerlin, 2006) in the US, social enterprise is termed to be non-profit and market economy is driven but in contrast to Europe, It has an association/ co-operative and social economy driven (Kerlin, 2006). Due to the growth of social entrepreneurs in large

Citation Information: Kumar, S., Kumar, P., Wisetsri, W., Raza, M. & Norabuena-Figueroa, R.P. (2021). Social entrepreneurship education: Insights from the indian higher educational courses. *Academy of Strategic Management Journal, 20*(S1).

numbers and looking at their level of knowledge and skills, it is said that they can be groomed/ trained through a well-designed curriculum.

The evidence found when Harvard Business School (HBS) launched the course titled "Social Entrepreneurship" in the mid-nineties. Soon it spreads across the globe with leading business schools started offering social entrepreneurship education. It gathered attention and became a hot topic for discussion in various academic and professional forums (Peredo & McLean, 2006).

Social Entrepreneurship Education in India

In India, there are more than 700 universities, 37000 colleges and 11000 stand-alone institutions as per the latest statistics from the UGC website. The higher education sector in India has become an important source of promoting and supporting social enterprise sector in the form of developing start-up enterprises. According to a report published by Yes bank, there are more than 100 incubators in India and their focused areas are manufacturing, technology, innovation, health care and entrepreneurship. Although the focus area of these incubators are not exclusively on social enterprise or using business concept and tools to solve social problems, there are many pieces of evidence that major portion of incubates are using innovative approaches to give social impact (British Council, 2016).

There are a growing number of academic institutions those started academic courses on social entrepreneurship either as full-fledged postgraduate or diploma program. Social entrepreneurship education is progressing in India as many higher education institutions involved in social enterprises are found nowadays. The Tata Institute of Social Sciences (TISS) was one of the first academic institutions to introduce an academic curriculum on social entrepreneurship as two years full-time Postgraduate course *i.e.* M.A. in Social Innovation and Entrepreneurship in 2007. The course is designed for those who believe that social innovation and enterprise can work as a tool for social change. At present, there are other universities and AICTE approved institutions like Ambedkar University, New Delhi, Azim Premji University, Bangalore, SVKM's Narese Monjee Institute of Management, Mumbai, Institute of Rural Management, Anand and Entrepreneurship Development Institute of India, Gandhinagar are prominent academic institutions that offer a course either as a one-

Citation Information: Kumar, S., Kumar, P., Wisetsri, W., Raza, M. & Norabuena-Figueroa, R.P. (2021). Social entrepreneurship education: Insights from the indian higher educational courses. *Academy of Strategic Management Journal, 20*(S1).

year diploma or two years post-graduate degree on social entrepreneurship. Apart from this, various higher institutions are utilizing their expertise by researching social entrepreneurship.

Methods of Data Collection and Analysis

The main aim of this paper is to give a broader picture of social entrepreneurship education in India. This is done by reviewing the existing literature on social entrepreneurship across the world. It is important to note that the most prominent contributions are reflected in this paper. The major databases referred to in this case are Google Scholar, Scopus, and Thomson Reuters to identify and review the papers. Further, the methodology adopted by the researcher includes identifying the HEIs offering postgraduate courses in social entrepreneurship either in the mode of full time or part-time or distance learning. This was achieved through secondary research and desk analysis. The narrative is built using the relevant documents available on the websites of HEIs. The content analysis approach is done for these documents thereby creating a constructive comparison among them. Thus, a broader picture obtained from the websites of five prestigious institutions whose program curricula and syllabi were accessed is utilised for further analysis.

Social entrepreneurship Education and Pedagogy in India

While pedagogy remains a central focus in education, designing an appropriate pedagogy for social entrepreneurship education creates multiple challenges. The existing SE curriculum is designed and developed to give facilitators a series of teaching methods to select from available options. These options are a combination of traditional lectures and discussion in class, case-based and field projects that include interviewing/shadowing the entrepreneurs, building a business plan for a social enterprise that is fictitious.

So far it is observed that the most common pedagogy used by academic institutions in India to run postgraduate course in social entrepreneurship is lecture, activities and simulations on a topic related to a social issue and critical discussion of cases on successful social entrepreneurs in India and abroad, immersion (field visit and rural visit), workshop components, and guest speakers. It is also evident that social entrepreneurship curriculum is greatly influenced by the foreign syllabus and pedagogy mostly from Europe and the USA and there is a lack of Indian literature on social entrepreneurship. Therefore, there is an

Citation Information: Kumar, S., Kumar, P., Wisetsri, W., Raza, M. & Norabuena-Figueroa, R.P. (2021). Social entrepreneurship education: Insights from the indian higher educational courses. *Academy of Strategic Management Journal, 20*(S1).

urgency to develop Indian case studies and syllabus based on social enterprise and has to be incorporated accordingly (Thomas & Reddy).

Table 1
LIST OF INSTITUTIONS/UNIVERSITIES OFFERING SOCIAL ENTREPRENEURSHIP PROGRAM

University/ Institution	Course title of post graduate course	Course objective and pedagogy
Tata Institute of social sciences, Mumbai	M.A. in Social Innovation and Enterpreneurship	The objective of two years program in social entrepreneurship is to help students to get the skills, knowledge, and mindset important to lunch social enterprise or act as an important role in existing one in a rural context. This program is interdisciplinary and combination of theory and cases, experience and student enquiry.
Despande Education Trust and Karnataka University, Dharward	Master of Social Entrepreneurship Program	The program imparts students important skill sets in social innovation, entrepreneurship development and business practice.
Ambedkar University	MA in Social Entrepreneurship	The purpose of this program is to make participant familiar with the emerging area of social entrepreneurship and the impact. It imparts specialized skills to start a social business venture that creates social impact. The teaching pedagogy used is reading activities, simulation on topics related to social issues and critical discussion of cases on live social entrepreneurs and enterprise.
SVKM's NareseMonjee Institute of Management, Mumbai	Part-time MBA in Social Entrepreneurship & Sustainability Management	MBA in Social Entrepreneurship aims to develop strategic Orientation and motivation of students towards creating a successful social enterprise that solves societal problems in an innovative way. The pedagogy used to teach the courses are lectures, case studies, academic analysis and framing the issue.
Indira Gandhi Open University and Centre for Entrepreneurship Development	MBA (Social Entrepreneurship)	The program is innovative and aims to equip professional in the social sector with knowledge and skills to address specific managerial problems and challenges in the social sector. The course is delivered through distance learning mode, lectures, and study materials.

As mentioned in Table 1, the institutions were using a variety of learning and teaching strategies to teach social entrepreneurship course. These strategies were started from traditional learning, e-learning, case studies, and hands-on projects, visits to social ventures, and the importance given to social innovation. The institutions were adopting different pedagogies to teach social entrepreneurship in a simplified manner. After evaluating the

Citation Information: Kumar, S., Kumar, P., Wisetsri, W., Raza, M. & Norabuena-Figueroa, R.P. (2021). Social entrepreneurship education: Insights from the indian higher educational courses. *Academy of Strategic Management Journal, 20*(S1).

curricula and contents of the above five institutions, it can be inferred that for an individual to be a successful social entrepreneur, she should be aware of both business and social aspects. However, the hurdle lies in the type of education being imparted to social entrepreneurs in terms of its sufficiency to cater to the need of both business and social models which is still an on-going debate.

Challenges in Social Entrepreneurship Education: Mono- disciplinary or Multi-disciplinary programs

The different issues discussed in social entrepreneurship in the previous section indicates that social entrepreneurship education should able to handle financial and marketing needs on one hand and societal problems on others.

Tracey and Philips had given importance to the business education for the entrepreneurs but one must keep in his mind that a social entrepreneur has to accomplish social objectives. It means that social entrepreneurs need to be trained in a different discipline to help them to face the challenges.

Dees has emphasized that students should develop a capability to resolve a social problem innovatively with the help of cross-disciplinary learning.

The social entrepreneurship education imparted in the US for the postgraduate students focuses majorly on inculcating the marketing skills. On contrary to the courses that are offered at the public administration schools targets predominantly philanthropic and political skills. This is due to the reason that the social entrepreneurship educators should ensure that there is mutual learning supporting in equipping the students with all the skills (Mirabella & Young, 2012).

DISCUSSION AND FINDINGS

Social entrepreneurship in India is mostly developed based on the understandings of the faculty members of universities and limited international exposures. However, for an emerging economy like India, it needs further concentrated investigation due to the vividness of problems to be catered via social business models. But the research in this area is limited and confined to the definition of social entrepreneurship. It doesn't cover the pivotal aspects such as nature and dimensions of social business model, contemporary issues that could be

Citation Information: Kumar, S., Kumar, P., Wisetsri, W., Raza, M. & Norabuena-Figueroa, R.P. (2021). Social entrepreneurship education: Insights from the indian higher educational courses. *Academy of Strategic Management Journal, 20*(S1).

solved via social entrepreneurship, and both formal & informal modes of delivery of such an education (Arasti & Salamzadeh 2018). There are instances wherein the social entrepreneurship is compared with corporate entrepreneurship, intrapreneurship, sustainability, so on and so forth (Nigam et. al., 2014). However, social entrepreneurship as defined in the aforementioned sections has a clear distinction that it aims to solve a social issue utilizing the business concepts. This understanding should be focused on while formulating the curriculum in Indian Universities. But content analyzing as presented in Table 1 reflect a different picture. The course objectives column reflects a common theme wherein aspirants are trained in knowledge, skills and approach of setting a social enterprise. These aspects are important and experiential, but having a conceptual clarity along with the philosophy behind social entrepreneurship is vital to enable individuals to apply the right tool in resolving social problems (Salamzadeh et. al., 2013).

The problems of developing countries are different from the ones belonging to developed economies. Also, there is a great extent of variation in issues among developing countries as well. Thus, management of social enterprise requires a local understanding of the country and its problems because the social problems are extremely contextual. Along with this, there are certain characteristics of a social entrepreneur overlapping with conventional entrepreneurs such as leadership style, organisational culture, networking abilities, etc. boosting the success of social enterprise (Prasetyo, 2016). However, this local context is not fully incorporated in HEIs in India while imparting social entrepreneurship education. Much of the content is taken from international best practices that don't capture the essence of local social issues.

India is already suffering from the issue of low female participation in all socio-economic activities. This is contradicting the demographic dividend argument of India. It is extremely important to give due recognition to gender balance in creating social entrepreneurs in society. Without gender balance, several social enterprises would fail to provide gender-neutral solutions (Salamzadeh, Arasti & Elyasi 2017). None of the contents analyzed of the five universities in this research catered to the gender-sensitive approach of social entrepreneurship. Also, having a huge opportunity cost involved in pursuing social entrepreneurship refrain the female participation in such education in India.

Citation Information: Kumar, S., Kumar, P., Wisetsri, W., Raza, M. & Norabuena-Figueroa, R.P. (2021). Social entrepreneurship education: Insights from the indian higher educational courses. *Academy of Strategic Management Journal, 20*(S1).

Finally, the theoretical and practical contribution of this paper to the body of literature would include suggesting a comprehensive model of social entrepreneurship education in India (Salamzadeh, Salamzadeh & Nejati 2011). The current model of social entrepreneurship is operating in isolation from a prior understanding of the relationship with humans. It is infeasible to operate as a social entrepreneur without having basic knowledge in the stream of humanities. Current HEIs in India are operating on the earlier model wherein they are producing entrepreneurs rather than social entrepreneurs. Thus, the refined model should include a strong subset of the following disciplines to inculcate a strong behavior of social entrepreneurship that is successful and sustainable in long run.

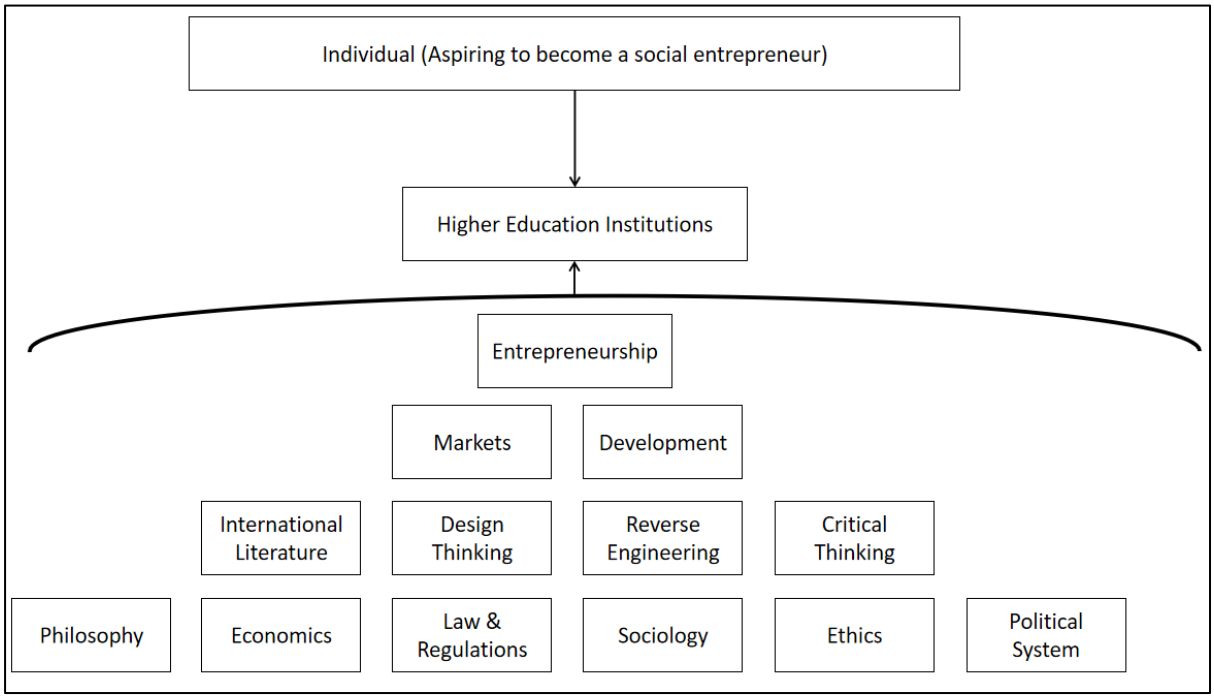

FIGURE 1

PROPOSED SOCIAL ENTREPRENEURSHIP MODEL

This model should attempt to stimulate the zest among the individual to pursue social entrepreneurship in HEIs (Sousa et. al., 2016). As a result of this, more and more employment opportunities will be created along with a private resolution to social problems. The role of government would be reduced in resolving social issues thereby providing higher bandwidth to them in catering to their major functions of providing public goods, national security, criminal justice, the judicial system and tax collection.

CONCLUSION

India's post-graduation level program on social entrepreneurship is still in its initial stage and slowly getting accepted across universities and institutions. The paper has given light on the social entrepreneurship education at post-graduation level in India. The data collected by the researcher on the five institutions from India indicate that when there was no significant difference exists in the design of the courses, the pedagogical input varies. Still, in infancy, the social entrepreneurship program is offered by selected institutions. Hence, the sample size in this study has been limited to five institutions. Nevertheless, the research serves as the beginning of a discussion for further increasing the spectrum of research in social entrepreneurship education at the postgraduate level in India.

A homoeopathic approach in the treatment of gastritis

Dr. Jyoti Patel, Dr. Vidhi Khamar, Dr. Nisha Manani and Dr. Megha Parmar

Abstract
Homeopathic medicines are prescribed on the basis of presenting complaints while taking into account the physical, emotional and genetic make-up that individualizes a person. This constitutional approach encompassing mind and body works at root-level. Homeopathy is very effective in managing all the acute as well as chronic expressions of gastritis; it also plays an important role in prevention of relapse of the condition. Here we are discussing detail about gastritis and its homoeopathic treatment.

Keywords: Homoeopathy, gastritis, homoeopathic medicines, constitutional, characteristics, rubrics, therapeutics

Introduction
Homeopathy is considered to be the most ideal method for treating Gastritis. In homeopathy the treatment for the gastritis is done only after detailed examination of the individual's sign and symptoms and constitution. Hurry and Worry that are at the base of the disease now a day and are related to one's nature and tendency, which can be tackled by a constitutional or individualized homeopathic treatment. The homoeopathic remedies are not just control the symptoms but they work deep inside and also prevent recurrence of the disease by treating the root causes successfully. For gastritis homeopathy is strongly recommended as it is safe and does not lead to any side effects. Due to holistic approach of the treatment in homoeopathy we can get rid of disease from physical as well as mental aspect also.

General View about Gastritis
Definition: Gastritis is an inflammation, irritation or erosion of the stomach mucosa.
Gastritis is not one disease but a group of conditions, which are characterized by inflammation of the lining of the stomach. Gastritis can broadly be divided into acute gastritis and chronic gastritis.
Types of Gastritis:
Gastritis can broadly be divided into:
1. Acute gastritis and
2. Chronic gastritis.

1. Acute gastritis: Acute gastritis is a sudden inflammation of the lining of the stomach. Acute gastritis is a term covering a broad Spectrum of entities which include inflammatory changes in the gastric mucosa. Inflammation of the whole stomach is called pangastritis and an inflammation of a part of stomach is called antral gastritis.
Acute gastritis can divided into:
Erosive and Non-erosive

Causes
Medications, alcohol, eating or drinking corrosive substances, extreme physiological stress, infections.
Acute gastritis is often associated with a severe, acute illness, or trauma.

Risk factors
Nonsteroidal anti-inflammatory drug use (NSAIDs), recent heavy alcohol use, and physiological stress such major surgery, head trauma, renal failure, liver failure or respiratory failure.

2. Chronic Gastritis

Chronic gastritis is an inflammation of the lining of the stomach that occurs gradually and persists for a prolonged time.

Causes

Prolonged irritation from the use of nonsteroidal anti-inflammatory drugs (NSAIDs), infection with the bacteria Helicobacter pylori, pernicious anemia (an autoimmune disorder), degeneration of the lining of the stomach from age, chronic bile reflux.

Sign and Symptoms

The signs and symptoms of gastritis include:

- A gnawing or burning ache or pain in the upper abdomen that may become either worse or better after eating.
- Loss of appetite.
- Bloating: A feeling of fullness in upper abdomen after eating
- Weight loss.
- Belching: Belching either does not relieve the pain or relieves it only briefly.
- Nausea and vomiting: The vomit may be clear, green or yellow, blood-streaked, or completely bloody, depending on the severity of the stomach inflammation.

In more severe gastritis, bleeding may occur inside the stomach. Any of the following symptoms can be seen as well as those already mentioned.

- Pallor, sweating, and rapid (or "racing") heart beat.
- Feeling faint or short of breath
- Chest pain or severe stomach pain
- Vomiting large amounts of blood
- Bloody bowel movements or dark, sticky, very foul-smelling bowel movements

Homeopathic Treatment of Gastritis

Homeopathy is one of the most popular holistic systems of medicine. The selection of homeopathic medicine for gastritis is based upon the theory of individualization and symptoms similarity by using holistic approach. This is the only way through which a state of complete health can be regained by removing all the sign and symptoms from which the patient is suffering. The aim of homeopathic medicine for gastritis is not only to treat gastritis but to address its underlying cause and individual susceptibility. As far as therapeutic medication is concerned, several remedies are available to treat gastritis that can be selected on the basis of cause, sensations and modalities of the complaints.

Rubrics of Gastritis in Reportories

There are so many rubrics given in the repertories related to gastritis. Some of them are given here:

[Boenninghausen's] Stomach, Inflamed, Acute gastritis
[Boericke] Stomach, Inflammation
[Boericke] Stomach, Inflammation, Acute
[Boericke] Stomach, Inflammation, Chronic (catarrh of Stomach)
[Boger] Supplimentry references, Gastritis
[Complete] Stomach, Gastritis
[Kent] Stomach, Inflammation
[Knerr] Stomach, Burnining, Gastritis, in
[Murphy] Clinical, Gastritis, Infection
[Murphy] Clinical, Gastritis, Infection, Chronic
[Murphy] Stomach, Gastritis, Inflammation, Chronic
[Murphy] Stomach, Gastritis, Inflammation
[Synthesis] Stomach, Inflammation, acute

There are number of medicines has been given in the Materia medica which has great affinity to cure the different kind gastric derangements. Some of them are mentioned here:

- Nux Vomica
- Lycopodium
- Phosphorus
- Arsenic album
- Carbo vegetabilis
- Mercurious Solubilis
- Veratrum album
- Bryonia alba
- Belladonna
- Argenticum Nitricum
- China officinalis
- Sulphur

Homoeopathic Therapeutics for Gastritis

Nux Vomica

It has great affinity to gastric derangement. It is pre-eminent remedy for the disease conditions arise due modern life style. Nux vomica is mostly indicated in case of chronic gastritis which is caused by tobacco, alcoholic stimulants, aromatic or patent medicines, sedentary habits, highly spiced food. Heartburn with flatulence for gastritis has nausea and vomiting in the morning He feels "If I could only vomit I would be so much better". Alternating constipation and diarrhea. Eructations sour, bitter; nausea and vomiting every morning with depression of spirits, after eating. Drinking milk seems to cause acidity. Hunger, but if he eats ever so little, he is satisfied and feels quite full. Repeated, violent vomiting of sour mucus with headache or with blood. Contractive, squeezing stomachache.

Lycopodium

It has pain in the pit of stomach when the hypochondria are pressed and pain in hypochondria when the pit of stomach is pressed. Indicated for gastritis has fullness even after a light meal, with no intestinal irritation. A grand characteristic of Lycopodium is "The patient goes to meals with a vigorous appetite, but after eating a small quantity of food he feels so full and bloated that he has to force himself to swallow another mouthful; and he leaves the table with his hunger, only momentarily satisfied." Craves everything warm, intolerant to cold drinks. Incomplete burning eructation rise only to pharynx, then burns for hours. Eructation ameliorates gastric troubles. Bitter taste in mouth at night, sour vomiting.

Phosphorus

Irritation, Inflammation and degeneration of mucus membrane. Gastritis with chronic erosion. Burning, gnawing circumscribed pain. The all gone, weak feeling at 11 a.m. starting from stomach to bowel. Craves for cold food and cold drinks which give relief temporarily, but are vomited as soon as they become warm in stomach. Very useful remedy in the vomiting of chronic dyspepsia. Hunger soon after eating. Sour taste and sour eructations after every

meal. Belching large quantities of wind, after eating. Throws up ingesta by the mouthfuls. Pain in stomach; relieved by cold food, ices. Region of stomach painful to touch, or on walking. Inflammation of stomach, with burning extending to throat and bowels. Bad effects of eating too much salt.

Arsenic Album
Restlessness is one of the grand characteristics of Arsenic. Ailments from fear, fright and worry. Foul, bitter or sour taste. Cannot bear the sight or smell of food. Great thirst; drinks much, but little at a time. Burning pain in stomach like fire, as if hot coals were applied to part, better by hot application, hot drinks. Acrid and bitter eructation. Irritative dyspepsia and acute inflammation. Nausea, retching and vomiting of slimy mucus tingled with blood. Trembling and coldness of extremities with pain in stomach and oppressive anxiety. Dyspepsia from vinegar, acids, ice-cream, ice-water, tobacco. Terrible fear and dyspnea, with gastralgia; with great exhaustion

Carbo Vegitabilis
Best suitable for Patient seems to be too weak to hold out. Persons who have never fully recovered from the effects of some previous illness. Violent burning in the stomach, with paroxysmal cramps which force the patient to double up; with flatulence. Putrid variety of dyspepsia. Slow digestion; feels as if a weight in the stomach, which is not relieved by eating; but after a few mouthfuls there is a sense of fullnesss. Eructations are rancid, putrid or sour. Heaviness, fullness, and sleepiness; tense from flatulence, with pain; worse lying down. Eructations after eating and drinking. Contractive pain extending to chest, with distention of abdomen. Colic, with the sensation of a burning pressure; much flatulence and sensitiveness of the pit of the stomach. Pain in the hypochondria like that of a bruise.

Mercurious Solubilis
It has deathly faintness at the pit of stomach. Profuse saliva in the mouth with a putrid or bitter or sour and rancid taste. Mercurial smell and taste in mouth. Stool hot, scanty, bloody, slimy, and offensive, with terrible cutting, colicky pains. Useful in painful acute inflammation. Tenesmus, not relieved by stool. A never get done feeling in the rectum. Complains worse in both warm and cold atmosphere. Stomach is chronically disturbed, sour eructations, regurgitations, heartburns etc.

Veratrum Album
Hiccups after hot drinks. Forcible eructations, mostly of air. After eating, empty eructation of air. After frequent eructation, copious ejection of mucus. Constant sick eructation with very violent cough. Voracious hunger, great thirst. Vomiting is –Slimy acid liquids with food froth. Yellowish green or white mucus. With black bile and blood. Colicky pain with salivation, profuse cold perspiration.

Bryonia
It is best adapted to persons of gouty or rheumatic diathesis. Great thirst for large quantities at long intervals. Pressure as from stone at pit of the stomach, relieved by eructation. Stool large, hard, dark, and dry, as if burnt. Diarrhea during a spell of hot weather; bilious, acrid with soreness of anus; like dirty water; of undigested food; from cold drinks when overheated, from fruit or sour foods aggravated in morning, on moving, even a hand or foot and ameliorated by absolute rest. Aggravation from any motion, and corresponding relief from absolute rest, either mental or physical. Pains: stitching, tearing, worse at night.

Belladona
Abdominal pain in short attacks, causes redness of face and eyes. Abdomen tender, distended; aggravated by least jar. Loss of appetite with desire to drink without thirst. Eructation and vertigo. Nausea and inclination to vomit. Violent stomachache after a meal. Bilious vomiting.

Argentum Nitricum
Violent belching and great relief from it. Pain is gnawing, ulcerative, referred to the pit of stomach. Vomiting of glairy mucus, which can be drawn into strings. Longing for sugar which aggravates the complaints. Pain in spot radiates to every direction.

China Officinalis
Homeopathic medicine for gastritis best suited to weak patients having low vital power. Sensation of satiety after a few mouthfuls of food. Sour, bitter eructations; flatus is offensive. Slow digestion and patient faints easily. There is a sensation as if food had lodged in the oesophagus. In cases where the food does not digest, but lies a long time in the stomach, causing eructations and finally is vomited out undigested.

Sulphur
Burning in the stomach. Gastritis caused by chronic alcoholism. When carefully selected remedies fail to produce favorable effects, especially in acute diseases, it frequently serves to rouse the reactive powers of the system. Weak, empty, gone or faint feeling in the stomach about 11.a.m. and can not wait for lunch. Congestion of abdomen. Stool acrid excoriating. It follows Aconite well. Sour eructation all the day. Long heartburn. Belching up of a portion of the food that had been eaten. In the morning inclination to vomit. Morning nausea. Bulked eructation on going to sleep.

Some Diet & Lifestyle Tips for Gastritis

- Eating habits. If you experience frequent indigestion, eat smaller, more frequent meals to buffer stomach acid secretion. Avoid any spicy, acidic, fried or fatty food. Practice good eating habits.
- Avoid alcohol. It irritates and erodes the mucous lining of the stomach, causing inflammation and bleeding.
- Don't smoke. Smoking interferes with the protective lining of the stomach, making the stomach more susceptible to gastritis as well as ulcers. Smoking also increases stomach acid; delays stomach healing and are a leading risk factor for stomach cancer. Still, quitting isn't easy, especially if you've smoked for years. Talk to your doctor about methods that may help you stop smoking.
- Switch pain relievers. Some may cause stomach inflammation or make existing irritation worse.
- Follow doctor's advice. Your doctor may recommend that you take an over-the-counter antacid or acid blocker to help prevent recurring gastritis.
- Maintain a healthy weight. Heartburn, bloating and

constipation tend to be more common in obese people. Maintaining a healthy weight can often help prevent or reduce these symptoms.
- Exercise regularly. Aerobic exercise that increases your breathing and heart rate also stimulates the activities of intestinal muscles, helping to move food wastes through your intestines more quickly.
- Manage stress. Stress increases risk of heart attack and stroke, increases stomach acid production and slows digestion. For relaxation practice yoga. Make a habit of regular exercise, morning walk, eat healthy, nutritious food, it boosts your immune system & makes you calm.

Discussion and Conclusion

Gastritis is the very common condition prevailing into the society now a days. Due to some faulty food habits and stressful modern life style plays major role in developing this disease. Here we have discussed some of the important homoeopathic medicines which are frequently prescribed on the therapeutic basis as well as on the constitutional basis also. With the help of homoeopathic medicine we can cure the gastritis as well as can check the disease progress of the it. The medicines which are prescribed on the basis of the constitution of the person or by individualization can also prevent the recurrence of the gastritis. So from this work we can conclude that the homoeopathic medicine are very useful in the treatment of the gastritis as well as to prevent the recurrence of gastritis.

ABSTRACT

Homoeopathy is a system of medicine that heals illness using substances capable of causing the same illness. From the proving's of Dr Samuel Hahnemann in 1790, there are over 2000 homoeopathic drugs that have been proved and are in used world over. homoeopathic medicines are prepared from a wide range of natural sources like plants, chemicals, minerals, animals, nosodes, sarcodes, imponderabilia, synthetic sources, allersodes, and isodes.

KEYWORDS: New sources, Preparation of medicine, Potency, Complementary Medicine.

INTRODUCTION

Homoeopathy is a system of medicine that heals illness using substance capable of causing the same illness, that is presenting the same symptoms & condition when administered to healthy people. After so many years homoeopathy had proven the science of holistic & scientific approach.

The Homoeopathic medicines are Prepared from wide range of natural sources & Homoeopathy had discovered two new sources i.e., Allersodes & Isodes.

Isodes are the Homoeopathic attenuation of botanical, zoological or chemical substances, including drug exciepients on binders; which have been ingested or absorbed by body & they believed to produce a disease which interferes with Hormesis.

MATERIALS AND METHODS

Theoretical Study

1. Homoeopathic journal,
2. Internet sites & database
3. Homoeopathic textbooks and Allopathic textbooks.

RESULTS AND DISCUSSION

Homoeopathic Medicines were in used traditionally for the treatment of various allergies, infections, toxicities, autoimmune diseases, chronic diseases and acute diseases.

The Homoeopathic medicines are prescribed on the basis of Homoeopathic cardinal principles "Similia similibus Curentur"

The practice of homeopathy has become contemporized to meet the challenges of today's industrialized, stressful society. Modern living has created chronic "diseases" that are unresponsive to conventional, symptom suppressing drugs. Alternative/ complementary practitioners have rediscovered the teachings of Hippocrates; "the cause is the cure" has been termed the isopathic or homeovitic approach. This contemporary approach is being used successfully to overcome chronic conditions often associated with toxicities.

CONCLUSION

Isodes is a new source of homoeopathic medicines is proved useful in treating toxicities and allergies. After meta- analysis of literature, the effect of medicines prepared from Isodes have good therapeutic effect in potencies (12C,30C, 200C).

Thus, based on study of isodes it can be concluded that isodes – Homoeopathic medicines (12 C, 30C, 200C)

Potencies in treatment of toxicities, allergies, autoimmune diseases, and infections.

Further analysis of different potencies of isodes can be studied in the in-vitro and in-vivo experiments.

Conflict of Interest
No any conflict of interest and no funding was provided.

ACKNOWLEDGEMENT
It gives immense pleasure to extend heartfelt thanks with an abounding sense of gratitude to our Teachers, all hospital staff for their support encouragement and guidance.

We take this opportunity to express our profound respect and humble regards to our career. We Would not have been What we are today without their effort, blessings and encouragement.

We pay our gratitude to Dr. Samuel Hahnemann for making us a part of this great external science.

ABSTRACT

Background and objectives- to study the efficacy of Homoeopathic remedies in the management of crevice in ano & providing relief in pain, constipation & bleeding to brief about the treatment facilities available for crevice in ano by giving treatment to 10 patients. Pearson's Linear Correlation Test Score for Constipation and Numeric Pain Rating Scale for Pain and its analysis.

Material and Methods- By using Pearson's Linear Correlation Test Score and Numeric Pain Rating Scale at Nirmala Holistic Healthcare & Research institute, patients who presented with diagnosed crevice in ano with the symptoms as frank bleeding, cracks, constipation, Pains were included.

Patients were given individual Homoeopathic medicines and placebo for a period of 70 days. Changes in crevice in ano symptoms were the main outcome measures.

Results- 10 patients were analysed. After 70 days in total with 4-7 follow up of each and every patient, a significant difference was found in constipation, bleeding and pain.

We get to know the efficacy of many Homoeopathic remedies like *Sepia, Arsenic Album, Nux Vomica, Lycopodium, Sulphur & Natrum Muriaticum* on patients on the basis of totality of symptoms. We wanted to see the reoccurrence of the diseases and it is absent when the patient came for follow up.

Keywords- Crevice in ano, Homoeopathy, Pearson's Linear Correlation Test Score , Numeric Pain Rating Scale.

INTRODUCTION

Crevice in ano is the most common condition in INDIA. According to the article published by WHO, there are approximately 17 – 20% of population in India suffered from crevice in ano. According to the recent study conducted on prevalence on crevice in ano in India by Indian proctology society in a defined population of some state. In London approximately 10% of population suffered from anal crevice in ano and among the anorectal disorders 4% of new patients are suffer from crevice in ano. This disease is seen in all age group but mostly seen in adults. The prevalence of crevice in ano in female is 58% and in male it is 42% & 12% of cases occurred in children.

Crevice in ano caused due to tendency of Chronic constipation, incorrect operation of haemorrhoids, Crohn's disease, anal sex, irritable bowel disease etc. Dietary habits such as non-veg, spicy food, low fibre diet are the risk factors for crevice in ano. It presents with pain & bleeding at anal region along with stool.

In Homoeopathy the duration of treatment varies from patient to patient, depending upon the duration and extent of the crevices. Most patients show significant improvement in about 4 to 7 weeks. Some patients may need longer course of medication.

MATERIALS AND METHODS

Trial design

Study Crevice in ano is done from various authentic books, of short practice of surgery by bailey & love's, A manual on clinical surgery by S. Das and also homoeopathic books. We also referred various research articles & journals.

10 cases of crevice in ano were selected after the screening which fitted in criteria of case definition inclusion detailed case taking, physical examinations and P/R Examinations. Pearson's Linear Correlation Test Score is used to assess constipation & Numeric Pain Rating Scale to assess pain was done while case taking & follow ups.

Patients and settings

10 cases of crevice in ano were selected after the screening which fitted in the criteria of case of, case definition. Detailed case taking, physical examination, P/R examination, Pearson's Linear Correlation Test Score& Numeric Pain Rating Scale.

Inclusion criteria of patients were above 20 years irrespective of any gender & socio-economic status. Presenting case with sign & symptom such as fissure/ulcers, constipation, bleeding through anus before, during and after stool, pains that are burning, pricking or cutting, itching on anal region, straining to pass stool are also eligible for the study.

Patients with following conditions were excluded: - patient below 20 years, pregnant woman, lactating mother, venereal diseases & HIV, patients who had not completed the 5 follow up, patients with psychiatric diseases and inability to comply with the study protocol.

Study was conducted at Nirmala Holistic Healthcare and Research Institute situated in Gorakhpur, UP. The study was carried out with detailed case study and their follow up in the health Centre.

Result

After completion of this study we had seen males are more prone to Crevice in ano than females. The patients who are 30 years or above are more prone to crevice in ano. In rural area People are more affected, aggravating factors & predisposing factors for crevice in ano are alcohol, tobacco, Chicken, spicy food, night watching, eating Non vegetarian& spicy food. The common symptoms observed study are pain after stool, bleeding during stool, & constipation. At the end of this study we come to know the effectiveness of homoeopathic medicines and also the effect of calendula mother tincture Sitz bath.

DISCUSSION –

1) We studied 21 cases of P/R Bleeding & pain at anal region .

2) We included 10 patients out of 21 patients who are fulfill our case definition & Inclusion criteria.

3) We excluded 11 patients-

- Prolapse of rectum – 1pt.
- 3rd grade perineal tear with recto-vaginal fistula – 1pt.
- Heart complaint but no Crevice – 1pt.
- Perianal abscess -1pt.
- Drop out – 7pt.

4) Age wise distribution –

- 1 = 20 – 30 yr. Age group.
- 3 = 31 – 40 yr. Age group.
- 3 = 41 – 50 yr. Age group.
- 3 = 51 yr. above Age group

5) Sex wise distribution –

- 7 = Male.
- 3 = Female.

6) Place wise distribution –

- 4 = Urban.
- 6 = Rural

7) By considering an occupation, out of 10 patient –

- 4 = Farmer.
- 1 = Housemaid.
- 1 = Security guard.
- 4 = Other occupation.

8) By considering risk factors –

- 2 = Alcohol.
- 2 = Tobacco.
- 5 = Chicken.
- 8 = Spicy food.
- 1 = Night watching.

9) Pain relief –

- 10 = relief.
- 0 = no relief.

10) Bleeding relief –

- Out of 10 patient, 7 patient are with bleeding.
- 7 = Bleeding nil.
- 0 = No relief.

11) Constipation relief –

- 8 = Relief.
- 2 = No relief.

12) Remedy used –

- 3 = Nux Vomica.
- 2 = Lycopodium.
- 2 = Arsenic Album.
- 1 = Sulphur.
- 1 = Natrum Muraticum.
- 1 = Sepia.

13) Fissure healed –

- 4 = fully healed.
- 4 = partial healed.
- 2 = no healed.

We can give relief to anal pain, bleeding & constipation in cases of Crevice in ano.

CONCLUSION

We studied 21 cases of P/R bleeding out of which 10 cases of crevice in ano were assessed in terms of constipation using Pearson's linear correlation test score, assessment of pain by NPRS and assessment of bleeding. By providing Homoeopathic management regular follow up was done and we observed cases of crevice in ano in which patients had relief from constipation, pain and bleeding by Homoeopathic treatment. And we come to know about the role of *Calendula* mother tincture in sitz bath for crevice in ano patient to relief pain.

In this study Homoeopathic interventions relieved crevice in ano symptoms and along with it there is no reoccurrence of any symptoms.

Acknowledgement

It is a humble attempt made and apt to recall those with gratitude who have helped us to carry out this study. We wish to express our gratitude to Honorable Dr. D.K. Rai (General Surgeon),Pulse Hospital, Gorakhpur for his kind permission to carry out the study in this institute and valuable suggestions given to us time to time during the course of study.

It gives immense pleasure to extend heartfelt thanks with an abounding sense of gratitude to our Teachers Dr Manisha Prashant Gajendragadkar , Dr.V.K. Singh,Rohit Homoeo Hall, Azad chowk,Gorakhpur. all hospital staff and patients for their support encouragement and guidance.

We take this opportunity to express our profound respect and humble regards to our Parents Mr Neeraj Kumar & Mrs Rita Kumari, Mr. Anil Kumar Singh & Mrs Nirmala Singh We Would not have been What we are today without their effort, blessings and encouragement .

We pay our gratitude to Dr. Samuel Hahnemann for making us a part of this great external science.

Homoeopathic Drug Standardization through Biological Evaluation- Future Perspective

Vineeta[1], Atul Kumar Singh[2]

[1]Post-Graduate Scholar, Department of Homoeopathic Materia Medica, Anand Homoeopathic Medical College & Research Institute, Anand, Gujarat, India
[2]Director and Homoeopathic Physician, Nirmala Holistic Healthcare and Research Centre, Singhadiya Chauraha, Near Vishnu Mandir, Deoria Road, Gorakhpur, Uttar Pradesh, India

ABSTRACT

There is a scarcity of chemico-analytical method of standardization of high dilution of homoeopathic drugs. Homoeopathic medicines include any drug which are prepared by the methods given in homoeopathic pharmacopoeias. Efficacy of homoeopathic medicines are obtained by clinical use, from homoeopathic authenticated literature and research.

KEYWORDS: *Homoeopathy; Drug standardization; In vitro trial; In vivo trial; Ultra-high dilution; Biological evaluation*

INTRODUCTION

Homeopathic medicines include any drug which are prepared according to methods endorsed in homeopathic pharmacopoeias. Their therapeutic efficacy is established through clinical use, experience as recorded in authoritative homeopathic literature and to some extent by means of research. Homoeopathy is the most widespread form of complementary and alternative medicines[1,2]. Homeopathic medicines are prepared by vigorous agitating/shaking in a step wise manner known as potentization. The process of potentization is supposed to make the drug suitable to be given to an organism[3]. Homeopathic practice includes the use of potentized drugs routinely in high dilutions[4,5]. Various authorities have proposed certain pathways to explain the action of high dilutions[6-10]. Although some homoeopathic remedies contain molecules of the diluted compounds, a major and proactive claim of homoeopaths is that high dilution on the basis of Avogadro's number, are statistically very unlikely to contain molecule of diluted compound, do exhibit a biological and therapeutic effects. Various in vivo and in vitro model have been proposed to investigate this question[2]. The scientific investigation of ultra-high dilution has been triggered by recognition of therapeutic efficacy of homoeopathy. Homoeopathic medicines are often used in extremely high dilution-including ultra-high (or ultra molecular) dilution. It is extremely unlikely that any molecule of the starting substance persists[11].

Homoeopathy is a time tested two century old empirical system of healing. Homoeopathic medicines are prepared through a characteristic process known as potentization where serial dilutions are performed with succussion at each step of dilution[12]. Homoeopathic pharmacists prepare medicines from various biological active substances that belongs to two main groups: organic materials (plants, animals and nosodes) and inorganic substances (synthetic chemical, metals, alloys and natural & synthetic ceramic materials)[13]. To make homoeopathic medicines they are diluted hundreds, even thousands of times to reduce their toxicity and to ensure that they are biologically active and compatible with human physiology[9].

New evidence is emerging on the nature and properties of high dilution of homoeopathic medicines. These findings indicate that the science of homoeopathy is a form of nano medicine, with the medicines capable of initiating changes in the physiological and biochemical dynamics of the animal as a complex adaptive[14].

MATERIALS &METHODS

Theoretical Study: -

1. Homoeopathic journal,
2. Internet sites & database
3. Homoeopathic textbooks and Allopathic textbooks.

RESULTS AND DISCUSSION

Homoeopathic drug standardization by ultra-high dilution have a reproducible biological activity on human and mice basophils. There is enormous amount of experiments conducted over a long period. After all the experiments that have undergone in the past, will give a glimpse about the bright future of acknowledging the standardization of Homoeopathic medicines in a broad aspect. For future references it will increase the legitimacy and genuineness of the Homoeopathic medicines. We should also try and doing this on humans for better understanding. By including the drug standardization, we can develop a new technology to the homoeopathic world or fraternity. We can also assure the quality of the drugs by initiating the process in Homoeopathic science. As the medicines work on DNA of human beings so it is important to inspect it on humans. Some part of the homoeopathic Materia Medica will also increase by doing this process and increasing the affinity of Homoeopathic medicines. It will also clear the misconception about the placebo effect of Homoeopathic dilutions.

CONCLUSION

After all, the meta-analysis it is clearly understood that biological evaluation for homoeopathic drug standardization is a key factor for turning out or changing the aspect towards the Homoeopathic science.

So, based on the studies of all the drugs standardization of homoeopathic medicines by evaluating biologically we can get more authenticity of the medicines. Also, by initiating it we can sort two agendas together that is the affinity of homoeopathic medicines and at the same time its originality.

These studies should at least be considered an encouragement for developing other protocols, organizing multi-center trials and gathering multi-disciplinary specialists leading to a new and synthetic approach to this phenomenon.

CONFLICT OF INTEREST

No any conflict of interest and no funding was provided.

AKNOWLEDGEMENT

I would like to express my sincere gratitude to my supervisor Dr. Valavan sir for providing his invaluable guidance, comments and suggestions throughout this project. I would specially thank Dr. Atul kumar Singh for constantly motivating me to work. Also, I would like to thank my parents Mr. Neeraj Kumar and Mrs. Rita Kumari for their support and encouragement to work hard.

Kingdom Fungi 'A Compilation of Group Symptoms at a Glance'

Dr. Vineeta Neeraj Kumar

Assistant Professor, Department of Surgery, Aarihant Homoeopathic Medical College & Research Institute, Bhoyan Rathod, Gandhinagar

ABSTRACT

Homoeopathic medicines are made out of fungi. Fungi are very large group of thallophytes without chlorophyll. There are harmful as well as useful fungi. Fungi causes diseases in human being animals and plants. The reason why some fungi are so dangerous is that unlike any other living things, fungi are able to assimilate extremely complicated organic compounds which attack common organs. I have undertaken prospective type of study of fungi group of remedies group profile.

KEYWORDS : Fungi, Homoeopathic Medicines, Mycology, Fungi Group, Homoeopathy

AIMS & OBJECTIVES

To prepare group profile of fungi group and verification of theoretical group profile.

INTRODUCTION

Homeopathy is not that easy task, every patient and each and every medicine needs to be studied very precisely and deeply. It is an artistic science. It is very tough to study and memorise each and every medicine in its whole aspect.

Faced with the enormous number of living organisms on earth, scientists have long realized that we needed a way of classifying and naming individual species. The Greek philosopher Aristotle devised a primitive classification system over two thousand years ago. In modern biology, an organism is generally classified on the basis of its evolutionary relationship to other species, including anatomy, genetics and reproductive behaviour.

Kingdom Fungi, as represented in homoeopathy, is a relatively small group. Considering the diversity of fungi in nature, and the biological importance within the ecosystem it is surprising that the kingdom does not have a deeper understanding and a greater use in homoeopathic practice [1].

Kingdom Fungi contains the fungi, which are mostly multicellular eukaryotes of varied structure that share a common mode of nutrition. Fungi either live as parasites on other living plants or animals, or they live in decaying matter. In either way they derive their energy by breaking up highly complex substances (when these are broken down in another living organism, the organism suffers). Therefore, like animals, fungi are *heterotrophic* and consume performed organic matter[1]. Fungi, however, are heterotrophic by absorption; animals are heterotrophic by digestion[2]. Most fungi act as *saprotrophic* decomposers that aid the cycling of chemicals in ecosystems. They, along with bacteria, enrich the immediate environs with inorganic nutrients and thereby keep chemicals cycling in the ecosystem. Some fungi are *parasitic*, especially on plants, and others are *symbiotic* with plant roots and algae.

Fungi are characterized by non-motile bodies constructed of apically elongating walled filaments (hyphae), a life cycle with sexual and asexual reproduction, haploid resulting from zygotic meiosis, and heterotrophic nutrition. The characteristic cell wall components are chitin and glucans[3]. Exceptions to this characterization are well known. Fungi as a biological group have been classified into a kingdom on its own separating them from the plant kingdom. Robert Whittaker proposed that organisms should be broadly divided into kingdoms, based on certain characters like the structure of the cell, mode of nutrition, source of nutrition, interrelationship, body organization and reproduction[1]. According to this system, there are five main kingdoms[4].

They are

Kingdom monera

Kingdom Protista

Kingdom fungi

Kingdom animalia

Kingdom plantae

Kingdoms are divided into subgroups at various levels the following flowcharts show the hierarchy of classification.

Kingdom >phylum>class>order>family>genus>species

Fungi are a very large group of thallophytes without chlorophyll. They reproduce by means of spores. They may occur in soil, water or on other living organisms etc. There are harmful and useful fungi some like mushroom are edible. Fungi are widely used in certain industries; antibiotic penicillin is produced from the fungus penicillium[4].

Oxygen is required for cellular respiration and is used to break down nutrients, like sugar to generate ATP (energy) and carbon dioxide and water (waste) so, fungi do cellular respiration. STUDY OF FUNGI IS CALLED MYCOLOGY. Fungi grow usually best in environment that is slightly acidic. They can grow on substances with low moisture. Fungi live in the soil and on your body in your house and on plants and animals i.e., freshwater and seawater. A single teaspoon of topsoil contains about 120,000 fungi[4]. Fungi reproduces asexually by fragmentation budding or producing spores. Fragments of hyphae can grow new colonies. They have no leaves due to which their metabolism is catabolic[5]. Fungi play a major role in decomposing organic matter into inorganic. They can also cause disease in plants, animals and humans.

Fungi in Homoeopathy

The Homoeopathic medicines are prepared from vegetable (plant), animals, minerals, sarcodes, nosodes and imponderabilia. One more group is present on which very less light has been given and that is fungi group. Homoeopathic materia medica is a vast subject comprising of sign and symptoms of many medicines to study and specially to memorize all these medicines is a very difficult task**.**

SOME COMMON POISONS OF FUNGI:

- Amanitin – poison produced by mushroom. The mushroom is also known as death cup or the destroying angel. Upon ingesting the mushroom, symptoms are reported between 10-24 hours. Initial symptom includes; diarrhea and cramps. These symptoms usually go but after fourth or fifth day it is having severe effects in liver and kidney. Hence can damage the system.
- Orellanine- it is also a mushroom poison which can permanently damage the kidney.
- Gyromitrin- it is a poison which is similar to amantin.
- Muscarin- acts as a nerve poison and affects the heart and blood circulation.

CLASSIFICATION OF FUNGI KINGDOM:

The kingdom fungi contain five major phyla that were established according to their mode of sexual reproduction or using molecular data. The five true phyla of fungi are;

- Chytridiomycota (chytrids)
- Zygomycota (conjugated fungi)
- Ascomycota (sac fungi)
- Basidiomycota (club fungi)
- Glomeromycota

  "Mycota" is used to designate a phylum while "mycetes" formally denotes a class or is used informally to refer to all members of the phylum.

The different remedies of this group have been employed in various clinical conditions by different school of medicines since ancient time. Among them some are being well proved and some partially.

Homoeopathic remedies belonging to fungi kingdom

- AGARICUS EMETICUS
- AGARICUS MUSCARIUS
- AGARICUS PHALLOIDES
- BOLETUS LURIDUS
- BOLETUS LARICIS
- BOLETUS SATANAS
- BOVISTA
- PHALLUS IMPUDICUS
- POLYPORUS PINICOLA
- SACALE COR
- THALAPSI BURSA PASTORIS
- USTILAGO

Other rare homeopathic medicines prepared from fungi are:

- Agaricus campestris
- Agaricus citrinus
- Agaricus procerns
- Turula cerevisiae
- Psilocybe caecrulescens
- Solanum tuberosum aegrotans

Uses of fungi

- Decomposers of organic materials.
- Yeast is crucial for fermentation process that makes beer, wine and bread. Fermentation occurs in the absence of oxygen and allows the first step of cellular respiration, glycolysis to continue.
- Some fungi are used in the production of soy sauce and tempeh, a source of protein used in south Asia.
- Fungi can produce antibiotics, such as penicillin.
- Mushroom are fungi that are eaten by people all over the globe.
- They are major source of citric acid.
- They can be genetically engineered to produce insulin and other human hormones.

Properties of Fungi

- All of the fungi are eukaryotic. They possess membrane bound cell organelles including nucleus, mitochondria, Golgi apparatus, endoplasmic reticulum, vacuoles etc.
- They have glucans, mannoons and chitin in their cell wall and ergosterol in cell membrane
- They are non-motile because of rigid cell wall.
- They are chemoheterotrophs. They require organic compound for both carbon and energy resources.
- They are osmotrophic. Obtain their nutrition by absorption.
- All fungi are gram positive.
- Food storage is generally in the form of lipids and glycogen.

Formation of Group Symptom Profile

The group symptom profile is erected after study of remedies from the following books:

1. New manual of homoeopathic materia medica, William boericke.
2. A dictionary of practical materia medica, Clarke J. H.
3. Allen's keynotes, H. C. Allen
4. Concordant materia medica, Frans Vermeulen.
5. Materia medica of homoeopathic medicines, Dr. S. R. Phatak.
6. Regional reader, E. B. Nash.

After studying the medicines of fungi group from these books, the group symptoms profile will be formatted on the following bases:

- Symptoms which are present in two or more materia medica will be included in the group symptoms.
- Symptoms which are present in two or more remedies will be consider into group symptoms.
- Mental and physical general along with emotional presentation will be considered.
- Symptoms which are 3 marks & 2 marks are considered.
- The name mentioned in the bracket indicate the book in which this symptom must be present. (see abbreviations table)

CHARACTERISTIC FEATURES OF FUNGI GROUP

Constitution
Hydrogenoid constitution, General puffiness, bloated condition of body surface, in old people with indolent circulation, or drunkard, especially of their headaches.
At climaxis, old people.

Ailments from
Coitus, fright, mental application or excitement, over exertion, sexual excess, alcoholism, blood poisoning, subjective symptom arising after frost or sun, frostbite, all consequences of exposure to cold, use of cosmetics.

Miasm
All three miasms but predominantly Sycosis and tubercular background.

Temperament
Sanguine and irritable

Diathesis
Hemorrhagic

Thermal relation
Chilly

Sphere of action
It is noted that certain remedies have an affinity towards specific physiological systems, and the following sphere of action was noted in the case of kingdom fungi:
a) Central nervous system
b) Peripheral nervous system
c) circulation- haemorrhage tendencies

d) Female sexual organs
e) Skin
f) Male sexual organs

Patho-physiological action

- Central nervous system- they involve the cerebrospinal axis, producing irritation, inflammation, and degeneration.
- Produces spasm—ischemia—gangrene.
- Produces dilatation—relaxation—hemorrhage
- On skin- inflammation—exudation—eczema.
- Produces a state of intoxication and is used in many parts for making an intoxicating drink. [6,7,8,9,10,11]

Characteristic mental symptoms

- Anxiety [6,7,9]
- Confusion of mind[6,8,9,10]
- Delusions- enlarged, intoxicated, and poisoned, under superhuman control, low weight, visions. [6,7,9]
- Irritability. [6,7,9]
- Sensation as if boiling water running along the back. [6,8,9]
- Very depressed, weeps, desponding, feels null, great depression of spirit. [6,7,9,10]
- Prostration form sexual abuse and loss of semen. [6,8,9]
- Could not bear to see or talk with anyone, aversion to company. [6,9]
- Desire solitude to practice masturbation. [6,8,9]
- Awkward, inclined to drop things, from hands, objects fall from powerless hands. [6,8,9]
- Quarrelsome. [6,9,10]
- Great sensitiveness, irritable, takes everything amiss. [6,8,9]
- Weakness of memory, absence of mind. [6,9]
- Laughs and cries alternately. [6,9]

Characteristic physical symptoms

- Tendency to involuntary movements like twitching, jerking especially of the eyelids and tongue. [6,8,9]
- Twitching ceases during sleep. [6,8,9]
- Nystagmus and uncertain gait. [6,9]
- Clonic tetanic movements [6,9]
- Tendency to develop paraesthesia like tingling, numbness with or without pain or twitching. [6,8,9]
- Sensation as if pierced by cold or hot needles. [6,8,9]
- Shooting and burning along the spine. [6,8,9]
- Burning itching redness and swelling as if frozen.[6,8,9]
- Sensation of boiling water flowing along the back.[6,8,9,10]
- Tendency to hemorrhage. [6,8,9]
- Nose bleeds persistent in drunkards. [6,8,9]
- Bleeding dark, offensive and stingy.[6,8,9]
- Metrorrhagia- especially during climaxis. [6,8,9]
- Vicarious menstruation. [6,8,9,10]
- Congestive, passive or slow bleeding dark watery or in clots forming large black strings. [6,8,9]
- Tendency to increase sexual desire with masturbation.[6,8,9]
- Tendency to catch cold, feels very chilly yet aversion to covering.[6,8,9]
- Suited especially to females during climaxis.[6,8,9]
- Tendency to form new growth.[6,8,9]
- Complaints appear diagonally, upper left and lower right side.[8]
- Epilepsy from suppressed eruption.[8]
- Loss of hair and nails, complete alopecia.[8]

Particulars

HEAD

- Vertigo from sunlight, and on walking.[6,9]
- Lateral headache, as if from a nail.[6,9]
- Dull headache from prolonged desk work.[6,9]
- Icy coldness like icy needles or splinters. [6,8,9]
- Neuralgia with an icy cold head. Desire for warm covering.[6,9]
- Headache with epistaxis or a thick mucoid discharge.[6,9]
- Headache with epistaxis or a thick mucoid discharge.[6,9]
- Stammering.[6,8,9]
- Scalp itches, worse, warmth, sensitive, must scratch until sore.[6,9]
- Nervous headache from menstrual irregularities.[6,9]

EYES

- Lids agglutinated in morning. [8]
- Dim vision [6,8,10]

NOSE

- Nosebleeds in old people, with relaxed circulatory system. [6,8,10,11]

NECK AND BACK

- Aching along the spine and limbs, column sensitive to touch. [11]
- Painfulness along spinal cord when stooping every turning motion of the body causes pain. [8,11]
- Sensation of ant creeping along spine.[11]
- Itching coccyx. [6,8,9,10]

EXTREMETIES

- Twitching of gluteal muscles. [7,11]
- Itching, burning, and redness of hands, fingers, and toes, as if they had been frozen. [6,8,11]
- Chilblains that burn and itch intolerably. [7,8,11]
- Involuntary movements while awake, cease during sleep. [7,8,10]
- Chorea from simple motion jerks of single muscles to dancing of whole body, trembling of whole body.[8]

SKIN

- Burning, itching, redness and swelling as from frost bites. [7,8,10,11]
- Herpetic eruptions. [6,8]
- Pellagra, eczema, urticaria covering whole body [6,8,10]
- Itching aggravates at night. [6,9]
- Rubbing any part brought out the eruptions, skin hot. [6,9]
- Corns, warts shooting pains. [6,9]

FEMALE

- Menses flow only at night or only in the morning. [6,9]
- Passive Metrorrhagia of bright or dark blood, with many clots and pains in the ovaries. [6,11]
- Prolapsed, post- climacteric, hemorrhage, bearing down pain almost intolerable [6,10,11]
- Yellow and offensive leucorrhea. [6,10,11]

MALE

- Increased sexual desire, with flaccidity of the penis. [6,10,11]
- Scanty emission in coition. [6,7,10]

General modalities

WORSE
Climacteric, touch, motion, menses, cold.

BETTER
Bending double, hot food, eating

Clinical conditions
Gangrene, hyperpyrexia, itching, jaundice, lachrymal fistula, lichen, lumbago, Acne rosacea, blepharospasm, softening of brain, bunion, chilblains, chorea, coldness, cough, cramp, delirium tremens, dysmenorrhea, enteric fever, epilepsy, meningitis, myopia, neuralgia, numbness, nystagmus, phthisis, rheumatism, sebaceous tumor, sexual excess, tremor, typhoid fever, eczema, corns, gleet, urticaria, warts, whitlow, rheumatic affections, ovaries affection of, alopecia, climaxis, ovaries affection, tonsillitis,

Remedy relation
Antidotes- absin. Coff, Camph.
Compare- cimicifuga, cann. i, hyos, tarantula his, rhus t, Sep, cic, calc, Sabina. [6,7,8,9,10,11]

Clinical Cases

A Difficult Wisdom Tooth Eruption

July 17, 2024 • 2 Comments • by Rajiv Peres

Dr. Rajiv Peres shares a case of difficult wisdom tooth eruption. A careful comparison of two similar remedies led to the simillimum.

On 12th June 2023, a 23-year-old boy presented with complaints of pain in left lower wisdom tooth for the last four days. He was unable to eat anything on the left side. Touch aggravated.

He felt better by holding cold water in his mouth. A lot of saliva accumulates in region of left lower jaw and when he tries to swallow it creates pain in left aspect of throat radiating downwards. Difficult to even swallow saliva.

Face swelling present on left side with a pinkish hue. When he moves the jaw, some crackling sound is produced at left angle of mandible. For last three days he was on pain killers as well as antibiotics without relief. Pain and uneasiness are usually during daytime.

time. No peculiar taste of the saliva observed.

RESEARCH VETERINARY

Patient is aggravated by slightest touch. Pains fling upwards to the ears is absent in this case, so Staphysagria can be ruled out. Patient is not going crazy with the pain so he can't be Nux vomica.

I look for what is most peculiar and then later match it with the materia medica. This is an acute case, sporadic type. I search for concomitant, ailments from, characteristics, modality, sensation, and lastly location. What are characteristic and common symptoms in terms of intensity.

Patient is active despite pain but it's not very intense, onset is sudden, progress is fast, redness++, gum swelling. There is no characteristic mental concomitant in this case but physical concomitant is present of excessive salivation. Is there anything in the pain that makes it peculiar? What is the peculiarity of sensitivity? Nothing!

See also
Carbuncle on the back of the neck

In this case I also have characteristic uncommon peculiar modality, amelioration holding cold water in mouth. Some would argue here that in an inflammatory state holding cold water in mouth is a common relief, but do all patients having toothache hold cold water in mouth and feel better by it?

This phenomena of holding cold water in mouth and feeling better is individualistic. If you refer to sensodyne toothpaste advertisement from television "Jab Thanda piti

No characteristic peculiar sensations are available. Here location is available of left side. According to Kent and Boericke materia medica, Merc-sol is predominantly right sided.

Enormous salivation is present along with modality of cold water ameliorates. This symptom stands out as per the intensity of relief that it offered to him and also restlessness.

I find Boger- Boenninghauosen repertory (BBCR) ameliorated by holding cold water in mouth. Hence Merc-cor 30 was selected as the simillimum. 30c potency was chosen as the susceptibility seems low as he was unable to describe the type of pains or sensations, no presence of any mental symptoms.

Modality of better by cold water is a syphilitic expression and to avoid any unwarrented aggravation in an already suffering patient, low potency seems wise. Mer-cor also has aggravation by swallowing and worse during daytime unlike its counterpart Merc-sol which aggravated at night and more right sided. Salivation increased you shall find in both. Salivation brought me to Merc group, BBCR guided me to Merc-cor and Materia medica helped me confirm it.

Recurrent Cold and Cough in a Girl of 4

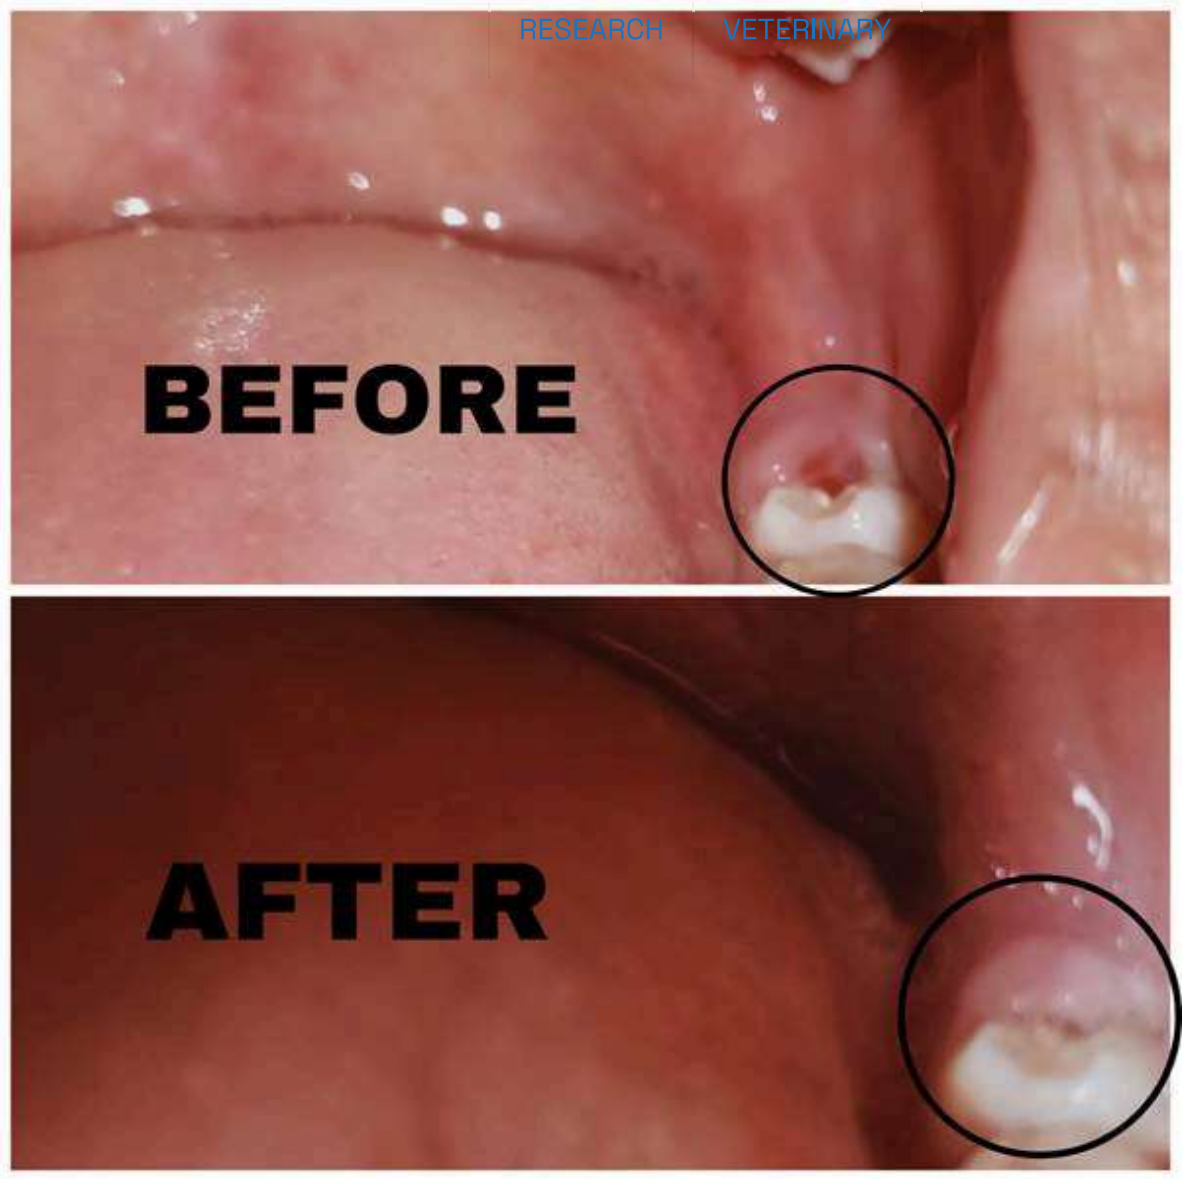
Follow up on same day after two doses of remedy on same day. First dose given was dry. Pain while swallowing eased within 8 minutes of first dose. Patient was insisting for another dose as he was in a hurry to feel better. Second dry dose was

Follow up on Next day 13th June 2023. After taking the remedy he could eat dinner the same night of 12th June. Overall 30% relieved. The remedy was repeated twice mixed in water.

Follow up on third day: Overall 60% relieved. Seemed happy and relaxed. No remedy given.

Follow up on fourth day: Overall 80% relieved. No trouble while eating nor while swallowing.

Photo’s below———



Follow up on Fifth Day 16th June 2023: 100% okay. No complaint.

The photo taken for follow up is on 22nd June 2023. Patient has not had the need any remedy till date.

14th November 2023: No recurrence of complaint nor any new complaint to this day.

Key words: Increased salivation – Better by Cold – Merc-Cor

Very nicely presented case – made for good learning – also you reinforced that the OLD is GOLD book of BBCR needs a look through once in a while surely.

did the cavity in the biting surface really healed? or the tooth moved and further tilted and the clean picture we saw is actually not the biting area as in eariler picture but the side of the tooth. Meaning, it has to be pulled eventually in some not distant future, anyway… and this is just the acute relief?

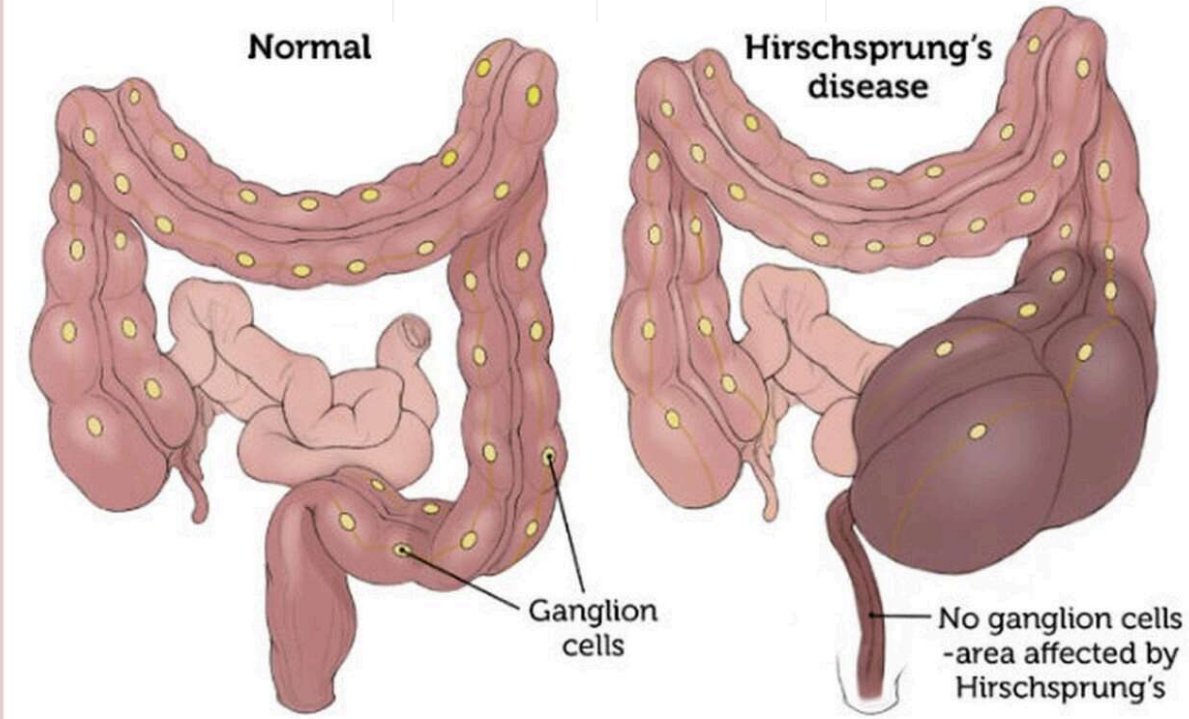
Clinical Cases

Hirschsprung Disease in a 3-Year-Old Boy

March 17, 2022 • 1 Comment • by Rajiv Peres

RESEARCH VETERINARY



Dr. Rajiv Peres presents a case of Hirschsprung disease in boy of three. The diseases is congenital and is due to missing nerve cells in the muscles of the baby's colon. The child improved in spite of the congenital nature of the disease.

Hirschsprung disease is congenital and is due to missing nerve cells in the muscles of the baby's colon.

On 18th July 2021 a boy of 3 years was brought by his parents who were both consultants (father psychiatrist and mother ophthalmologist). They asked me if I could offer something for Hirschprung disease. This child had chronic constipation since more than one year. He would pass stool once in 7 days with lots of straining.

Stool was dry and in between hard stools was liquid form (soiling) with mucus. He

RESEARCH VETERINARY

From 3rd month to the first year he appeared to be a healthy chubby baby and desired to be at the breast for 2-3 hours all the time. His teething, walking and speech were delayed. His weight was not increasing in the last 2 years. He was very cranky for the last 3 weeks.

During pregnancy his mother had guilt for not marrying the boy of her parent's choice. She was feeling guilty that she was not able to earn and give back to her parents what they had invested in her education. All her life she was a very sincere child dominated by her mother and grew up being afraid to take a stand for herself, except when it came to her marriage. She was experiencing low's and could not stand criticism. She had great fear of failure. Till the 6th month of pregnancy she had no interest in herself and a low mood. She suffered post partum blues.

This boy wanted to be very clean and would wash all his cars. He did not like to have a bath. He would be more active at night playing with his ball. He feared water, insects and was fond of dark chocolate. Thermally he was a hot patient. He was very caring towards his elder sister who was apparently healthy.

Appetite- good, demands apples, porridge, guava

Thirstless

Sleep- Prefers to sleep on one side

Family history:

Mother- I.B.S and depression

RESEARCH VETERINARY

Paternal Grand Father- Type 1 D.M, Born with staghorn calculi removed one kidney soon after birth, Bypass was done, Expired

Maternal grandfather- Aortic stenosis

Maternal grandmother- Mood swings, O.C.D

On Examination- The right ascending colon was stony hard.

See also
A Case of Renal Stones with Endometriosis and Hepatomegaly Responds To Homoeopathy

Appearance of child – Very Pale, distressed, afraid, timid, looking down, emaciated, dull, sitting in one position and crying when approached. Child was looking smaller for his age.

Anamnesis of the case:

Here we have a child who has a strong family history of syphilitic miasm yet, his constipation was more psoro-sycotic and it was not congenital. The constipation had made him sedentary. His milestones were delayed. Initially I thought of Carcinosin. However, his constipation alternating with diarrhea (alternating state of symptoms) is a sign of psora) and his tendency for retention of stool is a sign of sycosis.

in a child (uncommon). I prescribed **Sulphur 0/1** on 18th July 2021, one dose daily to begin with.

Follow up on 22nd July 2021 – He is able to pass gas and straining at stool has reduced. Earlier he would pass gas three times a day and now he is able to pass gas all throughout the day and even in his sleep. Passes small quantity of stool little by little, semisolid type.

Now no mucus in stool. Abdomen is still distended however, soft on touch not stony hard. Earlier he would suffer terribly with bloating if he ate a biscuit, two days ago he ate biscuits and had no problems. He is no longer dull but has become playful. Pallor of the face has reduced. Sulphur 0/1 dose reduced to alternate days.

Follow up on 1st August 2021 – His mother informed that he is doing well and the pediatrician has put him on a stool softener and laxative. In 7 days he will undergo rectal biopsy under anesthesia in order to confirm whether ganglion cells are present in the distal colon. Sulphur 0/1 reduced to twice a week.

Follow up on 8th August – Since last 5 days he has not passed stools and soiled only twice. Abdomen is swollen and fecal matter can be felt on palpation. Rectal biopsy was postponed to 13th August 2021. He wants to eat sweet porrige. Goes for bath more readily now. Child was silent, dull, abdomen was soft on examination. Sulphur 0/2 was started daily dose from 8th August 2021.

Follow up on 17th August 2021 –His father informed me that the boy is not well. He is straining all the time and not taking enough food and water, just like before. I increased his dose to Sulphur 0/2 twice a day.

Follow up 0n 18th August 2021– Rectal biopsy was done successfully and histopathology report confirms the diagnosis of Hirschprung's disease with no ganglion cells present. He is passing stools better than before but the straining still persisted. Same medicine was continued with reassurance to the father.

Follow up on 19th September 2021 – Yesterday patient passed normal stool, well formed. He gets nightmares. Overall 60% improved. He has good appetite and asks for food. He was also given enemas every day as per guidance of their pediatrician. For the first time I saw this child jumping and playing in my clinic. He was also talking and smiling. Abdomen was very soft on palpation. Prescription given was Sulphur 0/2 reduced to once a week.

Follow up on 31st October 2021 – Eating has increased to double the quantity. Shows more confidence. He stopped breastfeeding during the day. Able to pass stools without any help. Stool is hard. Stool softener has been prescribed by the pediatrician to make the process painless. Drinks less water. Sulphur 0/3 was prescribed once a week.

Follow up on 3rd December 2021 – Child is mentally cheerful, playful, very energetic and confident. Great appetite. No distension of abdomen, passing stools once or twice a day. Weight gained in the last 4 months is 3kgs. Also can used to strangers in a short time than before. He has also started to talk a lot and is willing to share his things with others.

Follow up on 18th December 2021– Child is well and playful. The family has relocated themselves to another state and child has no complaints. Continues to be on

RESEARCH VETERINARY

This case evokes certain questions as to how homoeopathic medicines were able to manage this child suffering from Hirschprung disease in absence of ganglion cells. I believe homoeopathy has always something at the back to offer for hopeless cases. Hopeless because the best pediatric surgeons in Jehangir hospital Pune, India were planning for a 3-stage surgical procedure. Homoeopathy rewarded this child of 3 years and his parents for never giving up.

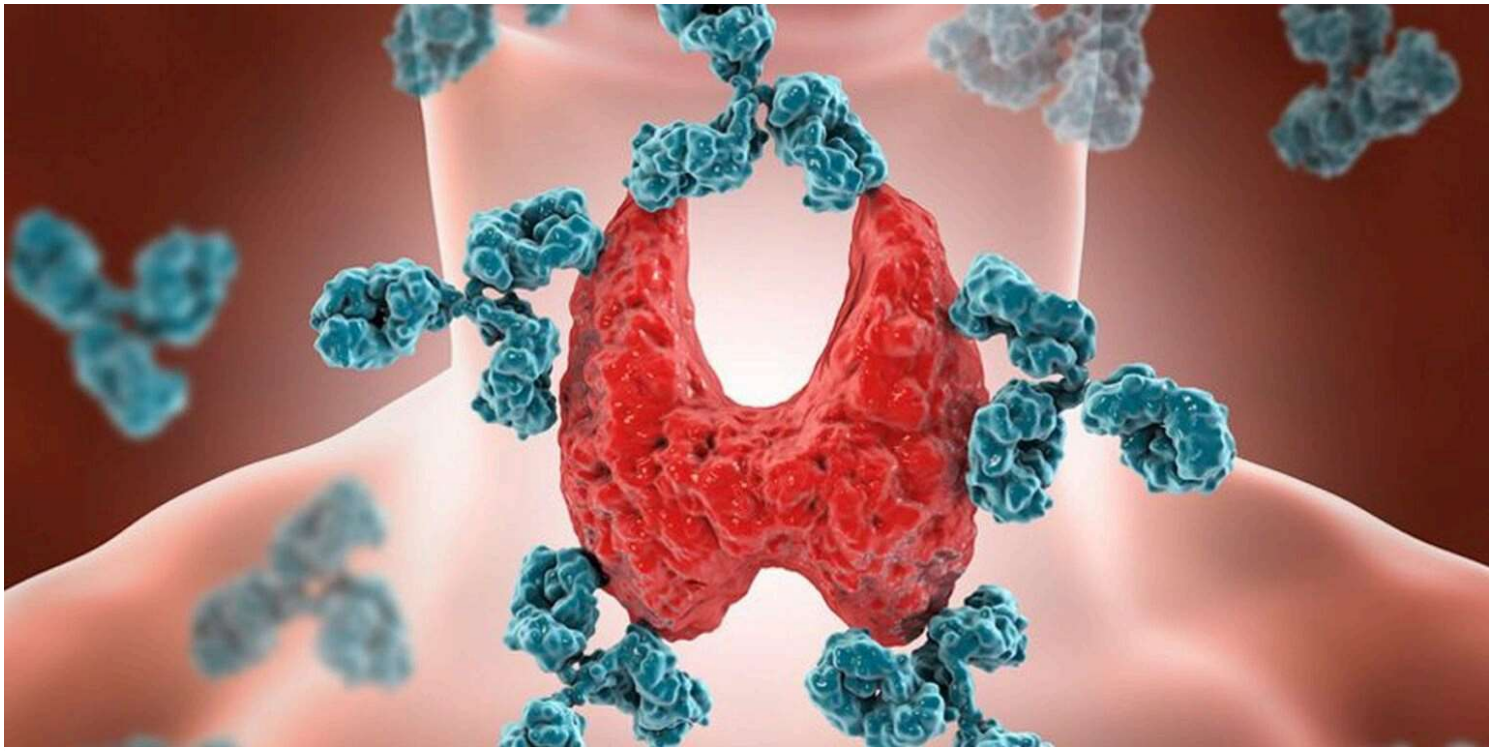
Sub-Acute Thyroiditis Post Covid-19

April 19, 2022 • Add Comment • by Rajiv Peres



Dr. Rajiv Peres shares a case of post Covid Sub-Acute Thyroiditis in a man of 46. The patient presented with severe burning from right ear to the neck.

submit paper for publication

Low publicatio charge with certificate in Peer-reviewed Refereed Journals

On 16th August, 2021 A 46- year- old male, who works as helper in the fabrication workshop presented with complaint of pain in right ear extending down to the lower aspect of right side of the neck since June 2021. He was unable to swallow his food normally for the last 15 days.

He complained of severe burning from right ear to the neck with sensation as if someone is eating his ear. He wanted to have a cold rain water bath. He could not tolerate any noise and got very irritated, wanting to beat his children when they made noise.

He would feel tired easily while speaking. His voice was weak and I could not understand his words, since articulation was indistinct and forced. He spoke hastily and there was a considerable amount of shortness of breath. He would get fever in the evenings at 4pm with chills, heat and body ache for the last 4 months.

Since Covid in April 2021 there was aching pain in both calf muscles and his body felt shaken up the last 15 days (beginning of August 2021). After suffering from Covid his thermal state had changed to his being a chilly patient.

Two months ago in April 2021, he had headaches and body aches, vertigo <talking associated with chest discomfort and was diagnosed as Covid positive.

In July 2021 he had severe pain in the right ear and neck, was getting fever on a daily basis and he could not go to work. In end of July 2021, he visited the local health centre's ENT O.P.D and an ultrasound was done which revealed Multinodular Goitre with ill-defined nodule in right lobe.

At the same time his T3 level was raised (2.47ng/dl), T4 was raised (17.6ug/dl) and TSH was low (0.02u1U/ml. On physical examination the neck swelling was visible.

Physical Generals:

Appetite: Doesn't like to eat although hungry; he had a salty taste in his mouth. Since he was on antipyretic medicines for fever, he had a running nose which relieved him partly.

Cravings: He loves ice creams and custard and cakes. However, at present he avoids it consciously.

Stool: Constipated since last 15 days, scanty stool. Earlier he use to pass stools thrice a day.

Sleep: Disturbed by dreams. In dreams he would see that somebody had caught his throat. He also had a dream that he was discussing and trying to identify his mysterious sickness.

Thermals: Chilly patient

He had become impatient and angry due to months of suffering from fever, no work, no diagnosis and the whole family was afraid that he had cancer. In his locality three people had been found to be suffering from cancer, and this frightened his family all the more. He was an honest, well-behaved man but at his

Anamnesis of the case:

The first issue was to correctly diagnose the case, hence I decided to refer this patient immediately to endocrinologist Dr. Newman Correa. Dr Newman advised a Radio Isotope scan done on 11th August 2021 which confirmed that it is not malignancy but thyroiditis.

He prescribed some painkillers and the patient began feeling better. I knew that this relief would be short lived. Exactly 5 days later, the patient presented with neck and ear pains to my out-patient department. I thought that we should prescribe something befitting his present state of inflammation.

When I examined his enlarged thyroid, the right side felt spongy. I referred to Kent's Repertory – External Throat Goitre, Right and Goitre Painful. I had to select between Iodium and Spongia. I decided to prescribe Spongia because in Spongia the thyroid enlargement is spongy and secondly in concordant Materia Medica of Frans Vermeulen it is written that "Toasted sponge contains a small percentage of Iodine".

Thirdly, the pace of slow onset of symptoms of Spongia matched the description of the patient's symptoms as described by Dr J.T Kent, like for example the night aggravation and also the marked anxiety and fear of death with suffocation.

The 1st prescription was given on 16th August 2021 – **Spongia 30**, three times a day for five days. One may call this a pathological prescription or a phase remedy.

Follow up on 23rd August 2021 – The patient said that immediately on the first day of starting Spongia he got a fever. He usually got a fever 4-6 pm but this time it was rather 6-8pm. He did not take any antipyretic, and then on day two after commencing taking Spongia, no fever but he started with coryza that was thick, yellow and he felt relieved every time it was discharged.

The severe burning pain in throat was 100% relieved. The breathlessness also improved but was not completely back to normal. He was able to resume his work at the workshop from 23rd August 2021. No prescription.

See also
A Case of Autism

Follow up on 30th August 2021– Patient returned with complaint of burning pain radiating from left ear down to left lobe of thyroid (old symptom which was there at the time he contracted Covid in April 2021). He had developed strong craving for ice cream since 29th August 2021. No prescription was given

suffered from pains in left leg since last 8 days probably due to over working.

He had to strain to pass stools. He had breathlessness after exercise. He would also feel slightly giddy, better after eating sweets. Craving for ice cream was very marked. Here we took the opportunity to prescribe his constitutional remedy – **Phosphorus 30** (second prescription), twice a day for three days.

Follow up on 13th September 2021 – In the first 3 days of beginning Phosphorus 30 the left ear pains were 80% relieved. Thereafter in between, the pains returned and disappeared especially while riding his motorbike. Better by inserting cotton in to the ears.

Then his right ear pained. The pain in left side of thyroid was present when the ear pains appeared and also during sneezing. However, the pain was not continuous as before. After starting Phos 30 the constipation improved. Breathlessness which was during eating improved 10%. No giddiness. Craving for ice cream still persisted but avoids eating it. Left leg pain is okay. Overall he feels less afraid. He can even do mental work which he was avoiding all this time. No medicine was given.

Follow Up on 29th November 2021 – Patient had a follow up visit with endocrinologist and all his thyroid readings were in normal limits. No conventional medicine was prescribed. Homeopathically also no medicine was prescribed. No burning, no giddiness, no constipation. no craving for ice creams.

This case shows us that constitutional medicine will bring all the good if given at the right time. Although we were able to identify Phosphorus symptoms during the first visit, it would not have been correct to prescribe it, since the thyroid gland inflammation was more striking and Phosphorus had little role to act there. Homoeopathy displayed it precision in totally curing this case of thyroiditis.

Utility of Dreams in Homoeopathic Practice

January 18, 2022 • Add Comment • by Rajiv Peres

Rajiv Peres shares three cases in which the patient's dreams played a part in finding the simillimum. Magnesium carb, Veratrum carb and Natrum carb were remedies revealed dreams.

Case # 1 – Irritable bowel syndrome

On 2nd June 2020 A 31-year-old unmarried woman, Chef by profession, came along with her mother at the correct time of appointment (dressing was also very proper) and presented with complaints of severe dysmenorrhoeas since about 2 years. She experienced this ever since she got a uterine clean up done for her uterine polyps.

She had menses for 24 days and endometriosis and her sexual drive vanished. A USG done in 2013 confirmed a few endometrial cysts and endometrial polyp. She

RESEARCH VETERINARY

Her dysmenorrhoea began on the day of ovulation with unbearable abdominal pain every hour. Nothing helped. Her menarche was at 12 years but she always had profuse menses lasting for 8 days.

Her haemoglobin used to be low in childhood and 9mg/dl was the highest recording. She became sexually active at 12 years of age. Her mother said that the daughter always had love relationships and was a rebellious child. The mother described the patient's adolescence as a problematic one.

She hardly attended classes, was always busy with boyfriends and relationships. She often cut her wrist due to disappointments in relationships. She could hardly concentrate on studies as her moods were changeable.

She failed her I.H.M course exams several times and wanted to pursue modeling, however her mother objected. Her father supported her and brought her on track. She never listened to her mother.

At 22 years she got pregnant and had advanced into the 5^{th} month. Her parents were worried about their name in society and warned her that her career will be over if she continues the pregnancy, so she underwent an abortion.

It was very painful physically as well as emotionally. Till today she cannot forgive herself for allowing that abortion. She doesn't want to get married nor have children as she feels God will punish her with a deformed child. However, she loves children and will entertain and play with her friend's kids.

She cannot bear to see injustice done to anybody's children. She will go out of her way to help them and spend any amount of money to see them happy. She will not

RESEARCH VETERINARY

She is also overprotective about her younger sister who is 5 years younger. Her sister studies in Pune and when she returns to Goa she keeps a close watch on whom she is dating. However, Pune is out of her reach to do surveillance and so the patient feels helpless.

After the abortion she became serious and her teachers forced her to appear for exams which she passed. Today she is well placed in life and has achieved a lot. Her mother calls her an exemplary child now.

She has fear of being alone and getting rejected. Hence, she gives her very best at everything. She always feels that her mother, although a teacher, never expressed love towards her. Her mother by nature was unemotional towards her but very kind and patient towards her students at school.

Her mother would promise her that if she spoke the truth she would not be punished. But when she spoke the truth, her mother gave her severe punishment. Thereafter she began telling lies.

Her mother didn't like hugs and kisses, but when her sister was born, she observed that her sister was given much affection. At that time, she believed she was an adopted child and used to get dreams that her real family is coming to take her.

She felt that something was wrong with her because her mother didn't give her love. Her mother would leave her in the neighborhood and go to teach school. At that time her neighbor, a woman, molested her. She didn't tell her parents since they would never believe her, but to this day she sees that woman interacting with other children and worries about their safety.

RESEARCH VETERINARY

sacrificed many things happily to provide service to her. Her mother requested her not to put her in an “old age home”. The patient promised that she will never do such a thing and would always take care of her.

She has fear of people going away from her, (presently her boyfriend) but this originated in her childhood. Her father once had an affair and she remembers her parents fighting and her father telling her that she might have to be away from her mother.

She has been with this boyfriend for 10 years now and the last two years he fights with her for sex but she cannot satisfy him because of her bowel pains. They are so intense that she can hardly sleep. In her childhood till the age of 22 she could never sleep before 2 am.

Since the time of the abortion, she over thinks whenever she has to make a decision. The abortion made her emotional and she breaks into a cold sweat from every part. When she gets angry with others, she is patient but when she fights with her boyfriend, she physically assaults him and then she regrets behaving that way.

At such times she fears he might leave her and go away. She doesn’t mean to hurt him but her anger is so violent that she may even punch the wall. She wants a peaceful mind because presently she is thinking of the worst case scenarios. She wishes that she communicated better with her mother, however she feels her father is more broadminded. Her mother has fixed ideas about what is right and nothing beside that exists.

The biggest regret for her is that she got pregnant and that she had the abortion. She loves going for nature trekking and for road trips where she can experience

RESEARCH VETERINARY

She is thermally chilly, thirstless and sleeps in the foetal position on her left side. She can sense if a person is genuine and guided her father on whom to rent his shop to. She loves reading books because they take her into an imaginary world.

She seeks refuge in her phone to divert her mind and her boyfriend complaint that she is paying more attention to the phone. She likes music when she is sad but not otherwise.

See also
Homeopathy in Obstetric Disorders

Family history: Her father had bipolar disease and hemiplegia at 50 years due to aneurism, Type 1 D.M and HTN. Her maternal grandmother suffered from Parkinson's and D.M. Paternal grandmother also suffered from Parkinsons. Paternal grandfather also suffered from cerebrovascular accident at 45 years but survived till 80 years.

1st Prescription Colocynthis 200, 4 doses (Acute prescription) **June 2nd, 2020**

Colocynth was chosen based on sudden, violent cramping, being sleepless and restless with pains. Also, concomitant of irritability and painful breasts during menses

Follow up after 15 days – After the remedy she felt very relaxed and would not fester her brain with over thinking like before. On 6th June she got her menses but unlike earlier there was no breast tenderness nor irritability.

RESEARCH VETERINARY

Everything was going fine until two days before ovulation and suddenly hunger increased, and she was constipated and restless. Then she complained of terrible gripping infra-umbilical continuous pain, as if squeezing a knot in the intestines. It was >lying in bed with something hot on her tummy, hard pressure helps, going out and walking helps (gentle motion).

After the pain subsides, she needs to eat something which is followed by bloating of abdomen then she feels tightness, no energy to do anything and anxiety about things out of her control in general. Amelioration after stool, although not easy and >after flatulence. Since the pain has returned, she believes the old medicine will not work.

Colocynthis 1M, 1 dose given. Immediately pain disappeared within 2 minutes. Advised SOS dose with succussion.

Follow up after 28 days – Pain in abdomen reappeared around the time of ovulation. When Colocynthis 1M was taken it immediately resolved it. Overall, pain lasted only for 2 days and this time it was bearable. Usually it would go on for many days.

Follow up after 1 month– Pain in abdomen reappeared around the time of ovulation. Intermittent pain returns after 3-4 hours. Two days before the pain appears she gets bloating of abdomen and bit usually she has a flat tummy. Also she becomes thirstless 2 days before pain comes, which results in constipation.

Appetite increases during pain and is aggravated after eating. Overall she feels less tired, not overly stressed out and has peace of mind. Colocynthis settled the pain 60%. Overall this pain's frequency has reduced a lot in the last 2 months and it comes only 3 times a day.

RESEARCH VETERINARY

Also the intensity has reduced, now only on the first 3 days the intensity is more and needs Colocynthis every 2 hours but doesn't seem to help. Before the pain would last for 5 days.

Mag-Carb 1M, single dose was prescribed as her constitutional remedy-. July 2nd, 2020. **Magnesium because of dreams (that her real parents are coming to take her and also dreams seen as remedy response) and also due to repressions.**

Here the pathology of **spasms** >walking in open air and neglected feeling is again indicative of magnesium. The centre point or nucleus of this case is love and care. On one side she is impulsive and on the other side uncommunicative and going into a shell. The whole range of responses revolves around love and care (available or not).

This remedy is not conscientious but rather has an emotional mind. Intense, deep, thoughts, very difficult to remove from mind (cannot forget memories good or bad), one side retaliates and other side withdraws e.g. after abortion. Oscillating between pain and pleasure. Hypersensitive, hyper reactive and the tubercular miasm is dominant.

The central idea of Magnesium-carb from Materia Medica is, the lack of care, protection and nourishment as a dependent infant. This is confirmed through her dreams: dreams of being lost in the forest and dreams being lost at home.

Forest is a fixed symbol of danger. A place inhabited by ghosts and dangerous animals and the place where mysterious things happen like in fairy tales as well as lost in the magical world of the unconscious. In this case the dreams were indicative of Magnesium Carb.

RESEARCH VETERINARY

Follow up on 5th day – The first two days she was very emotional and had dreams which she never normally gets. Then from the third day onwards she observed that she is sleeping better and her pain disappeared. She is feeling much calmer and not so anxious. She is greatly appreciating homoeopathy.

Follow up after 15 days – Also after the remedy she got certain unusual dreams as if she is in a third degree competition on stage and has to answer certain awkward questions on stage. She woke up disturbed and for the first time could discuss her dream with her boyfriend.

She has changed from introvert to someone who is able to speak up. For the first time she refused and said no to do things because she was already tired. Usually, she would do things because she felt too guilty to say 'No'. She was also able to talk to her Mum with ease on issues like suicide.

She as fewer fights with her boyfriend and had sex with him which she just didn't feel like having before. Overall 90% better. Felt immense peace and realized that she never desired to be a chef but her mother showed her that line. She only wanted to be happy and give others happiness which she already has and that it's not necessary to be perfect to impress her family.

Follow up after 4 months– No recurrence of complaints. No new complaints. Treatment stopped.

Note: In this case the dreams started only after the prescription of Magnesium. This is because often repressed feelings, as we see characteristically in Magnesium's, will surface only after taking the remedy. Hence the dream is confirming that the simillimum is correct and acting.

Rajiv Peres

On 6th July 2020 A 40 year old married women who was trying her best to conceive presented with severe skin eruptions all over her body along with horrible itching since last 2 months. The eruptions were also on the scalp which prevented her from sleeping.

She would also suffer from headaches on and off. One year ago she had received Medorrhinum 200, 1 dose for left ovarian cyst producing menorrhagia and even allopathy was not helping. She was a shy housewife, very religious and spent her time in taking care of her mother- in-law and husband.

See also
Revisiting: And Now For Something Completely Different-- A Remedy For Raj

There was deep seated sadness since she had not been able to bear a child. Also there was worry about constructing a new home. but funds were not sufficient. She was a hot patient who was thirsty for hot drinks and desired for sour food stuffs. When she developed some bloating of the abdomen, she perceived it as if she had become pregnant until a scan cleared that delusion.

She had a very persistent dream of cats pursuing her at least 8 times a month. There was no special fondness for cats in real life. There were no special characteristics in this case. But the dream was a strange one. I looked it up under the rubric dreams of cats pursuing him (Nux-v, Sil, Verat-Alb).

herself pregnant and that she will be delivered soon. I prescribed Verat-Alb 200, 1 single dose.

Follow up after 15 days– Felt a lot of peace on the first 4 days of starting the medicine. Skin eruptions improved by 65% one the 3rd day. Also, the headaches that would occur completely disappeared. She was well for 7 months at one stretch.

Case # 3 – Swollen Ankles in a Woman of 32

A 32 year old woman recently married, presented with complaints of swelling in both ankles and extreme tiredness since last 3 months. For the last 3 months she had been running around to get arrangements for her wedding. She was under tremendous pressure due to non-cooperation from her siblings, two brothers. She had to work twice as much each day.

She is a teacher by profession and has to stand for long periods. Due to tension she ate more and her weight increased considerably. Also, she is prone to ankle injury, twisted while dancing.

Angered very easily especially with her siblings and with her brother who always discouraged her and a certain girl friend who criticized her. By nature she is sensitive to rudeness and weeps quietly.

She is not basically a fighter but rather a family type of girl. Very caring of her brother's and family's honour. Of late her digestion is not good and she suffers from diarrhea easily. Bloating of abdomen.

Appetite- good. Craving for sweets. Thirstless. Thermal-Chilly patient

RESEARCH VETERINARY

Sleepless till 1 A.M. due to thoughts of unpleasant events of past. Falls asleep while travelling to work.

Dreams- Repeated dreams of going on a journey at least thrice a week with family members around and wakes up with the dream in the morning.

On Examination: Eyes- Pallor+ Blood Pressure- 120/80 mmHg

Anamnesis of case:

Boenninghausen's Therapeutic pocket book was consulted: 1)**Dream of Journeys. 2) Dreams constantly ongoing after waking.** The only remedy covering both these rubrics; **Natrum-Carb.**

Phatak mentions under Natrum-carb great debility from exertion, anemia, irritable and occupied with sad thoughts. Anxiety, fearfulness and gastric weakness by slightest errors in diet further confirmed the remedy. Prescription made on 9th January 2020 Natrum-Carb LM1, 1 Single dose. Advised to take iron supplement and later resume exercise once she feels stronger.

Natrum carb is mainly indicated in cases of psychological and physical exhaustion because it has a big effect on nerves and digestion. Another striking feature is that Natrum-carb needs to have something in the mouth, and the distended belly is better after diarrhea.

Although Natrum carb lives through periods of sadness and depression, it can be happy too. Mood can be changeable, suddenly happy and suddenly angry and aggressive. And they dislike certain people like Sepia and Ferrum.

doesn't fall asleep while traveling. Last night she got a dream of returning home after travelling and saw her late mother and late grandmother receiving her at home. Thirst has improved. Less irritable than before. This is a case where the prescription was based on a dream since in this one-sided case nothing else was characteristic.

What are Dreams?

Freud claimed that the dream is a façade of psychic phenomena behind which its meaning lies hidden. It's a meaning already known to the dreamer on some level, but maliciously, so to speak, withheld from consciousness.

Dreams are not disturbers of sleep, but rather its guardians against disturbances. Dreams are the most common and the most direct expressions of the unconscious psyche, providing us clues in cases where there is an apparent paucity of mental/emotional symptoms.

All dreams are not equally important. The big ones often remain with us for a lifetime: 'I will never forget this dream'. Just as no two people are alike, no two people dream the same dream exactly for the same reason.

The key to find its usefulness is to understand it. Even when the homoeopath does not understand a dream, it can still be effective as a form of compensation for the patient. Many things, including homoeopathy can be effective without fully being understood.

Dr N.M Choudhary opines that a special study of dreams is essential because dreams are as guides for a homoeopath which specify a particular deviation of the

RESEARCH VETERINARY

Important cures have been recorded based on dreams alone. Hence a homoeopath needs to apply the full armory of our art to understand dreams. For example, we can see in the Staphysagria dream fights, battles, wars, telling her to finally stand up to the perpetrator.

They reflect the dreamer's anticipation of future alterations of consciousness. Take Sepia for instance, who initially loves and is dedicated to her family. Yet she can have dreams of killing her family members or of running away from them to find peace –even of killing her newborn baby.

For a long time, these patients can consciously suppress these feelings, but their dreams may reveal much earlier their inner self. Or the Carcinosin patient, who dreams about failure in examinations since he is 'not allowed to fail', a condition imposed by his parents or self-imposed.

Even when a dream is not found in the proving of a remedy, it still can relate to the essence of that remedy as evident in our 3rd case in which she was feeling deserted by two of her brothers, thereby taking a flight into fantasy in the form of a journey which helps to get totally disconnected from her forsaken environment.

Plantar Wart on a Woman of 23

August 17, 2021 • 1 Comment • by Rajiv Peres

RESEARCH VETERINARY

Homeopath Rajiv Peres treats a woman of 23 for a painful plantar wart. Local symptoms, a serious demeanor and family history led to the simillimum.

On 11th November 2020 a 23-year-old unmarried girl presented with complaint of a wart on plantar surface of left great toe. She had wrapped it up with a piece of gauze since it was extremely painful. She had this complaint for the last 3 months and had taken homoeopathic treatment from another doctor (Antimonium Crudum) which had failed. The wart would itch, worse by touch and worse in winter. It felt very hard and horny while examining it. A closer look revealed it to be like a cauliflower and it pained like needles.

Thermals- Chilly patient

X

Thirst- good

RESEARCH VETERINARY

Eliminations- good

Sleep- refreshing

She was sensitive to damp weather which made her sad. She also had a tendency for growths e.g., styes on eyes, lipoma on back and scalp. Her mother had suffered from depression and had been on psychiatric medications until she expired from a myocardial infarction at age 48. Her father suffers from warts on his body. He remarried and lives separately but provides monetary support to his two daughters.

She lives with her sister. Most of the housework is done by her sister since she has to travel a lot (53kms one way). She is extremely quiet, serious look on face and avoids eye contact. When she lies down and closes her eyes to sleep, she feels there is somebody else in the room watching her. She could not identify if it was some robber or ghost or something else.

X

5) Delusion specters, ghosts, spirits, sees.

Prescription: Thuja 200, 3 doses were given. November 11th, 2020

Follow up on 30 November 2020– After taking 3 doses of Thuja pain in the wart reduced on the 3rd day and after that she did not need to tie gauze for cushioning. . Itching stopped by the 5th day and the wart turned hard.

On the 7th day it began turning black. She also was developing another little wart on her right ring finger medial aspect which she had forgotten to mention before, and this wart disappeared.

full of smiles. She began to mix more with her colleagues at college.

RESEARCH VETERINARY

30th November 2020

Follow up on 11 December 2020– She came very excitedly to show me that there was no sign of plantar wart left. Her faith in homoeopathy deepened.

X

11th December 2020

Warts can be psoric, sycotic or syphilitic/tubercular. Psoric warts are itching, sycotic ones are flat, hard or cauliflower-like and syphilitic/tubercular warts are hairy and bleed easily. Hahnemann classified warts under local affections, not caused by traumas (Aphorisms 189-190).

Suppressing sycotic warts is also known to give rise to organic heart disease. Removing syphilitic warts can lead to serious complications as happened to my other patient who had surgery for a bleeding wart from his back and shortly was detected suffering from Parkinson's disease. The aim of therapy is not in first instance to make the symptoms disappear but to understand what happens inside

Revisiting Mystery Illness?

We are told that the Thuja tree loves to abide in wet, swampy places, and its habitat extends from Pennsylvania northwards to Canada. It is not by accident that the symptoms and conditions of this drug are brought out on or made worse by exposure to wet and dampness.

Grauvlogl listed Thuja in his hydrogenoid group which contains remedies like Calc, Dulc, Nat-s, Rhus-t., all having aggravation from cold wet weather. Thuja is generally a left sided remedy and patients may seem very serious by appearance.

They live a secluded, mysterious life, preferring to live alone and afraid of marrying. Seasonal depression in winter is also a well known aspect of this remedy. The feeling of being watched is described in Kent's materia medica as well as the idea that the soul and body are separated.

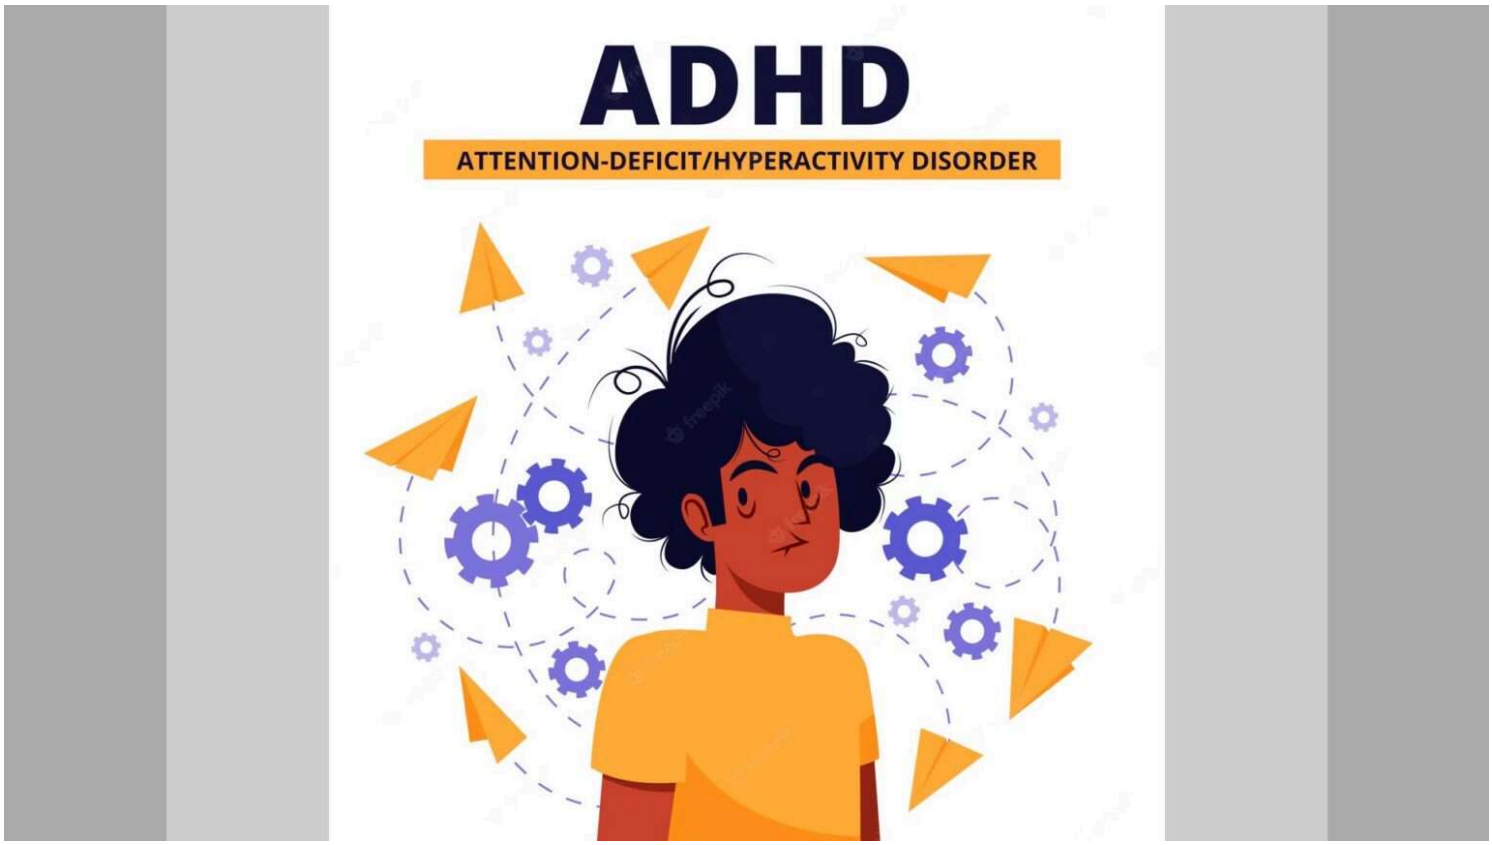
ADHD with Bipolar Disorder in a Man of 31

February 19, 2021 · 2 Comments · by Rajiv Peres



Dr. Rajiv Peres presents a case of bipolar disorder in a man of 31. Delusion he has done wrong, suicidal disposition, malicious, discontentment and highly manipulative were among the symptoms leading to a series of remedies which were curative. A very well managed case.

complained that he faces a lot of difficulty in concentration and doesn't feel like doing anything. He just feels like eating, at times overeating. He looked obese, around 93Kgs.

Tiredness felt in the morning and he doesn't wake up. He was an engineering student but dropped out and joined Bachelors in Commerce (a course offered to students after high school and intermediate studies). His reason for selecting the Commerce stream was that he wished to do business and never wanted to do a 9 am to 5 pm type of job. Presently he regrets this decision.

He's was a chilly patient and hated the rainy season. He preferred summers and desired sweets. He feels afraid of crowds due to anxiety. At this point he was holding himself responsible for his failure in life. He had fear of not reaching his potential because of his laziness. He had regrets that during his school days he did not participate in inter-class debate competitions or learning a musical instrument.

He suffered a lack of confidence. The stammering made him feel like a loser and he felt stale within himself. At class ten he suffered from obsessive compulsive disorder. He was always a hyperactive child and enjoyed manipulating others and enjoyed watching others fight for the trouble he created.

He had suicidal thoughts of hanging himself, because in comparison to his classmates he could not achieve anything in life. He said that he should support his parents at this age but it is the reverse, and that he had achieved nothing. When he would quarrel with his father he would say 'Die' to him.

Details of Family History of illnesses:

Father suffers from bipolar disease

Mother has Renal calculi, fibro-adenoma of breast.

Sister has obsessive compulsive disorder

Paternal grandfather had asthma

Maternal grandmother suffered from mental illness

Anemnesis:

I used these Complete Repertory rubrics:

1) Delusion Imagination, wrong: he has done

2) Suicidal disposition

3) Fear in a crowd.

His strong family history of sycotic-syphilitic miasm along with depression and the self-reproaching behaviour led me to prescribe **Aurum Met 200, 1 single dose**.

Follow up after 45 days– He had already been put on mood regulating psychiatric medications as well as psychotic medications on advice of a psychiatrist. He complained of catching cold easily. He would still not resist eating ice-cream.

Feels better after smoking (addiction). Also, he said that he cannot express himself, doesn't know what words to speak and that he is in a fight with himself. Also, he had developed a new fear of barking dogs. He could not tolerate correction. He had even raised his hand on his father. He liked to watch a lot of travelling videos. I decided to prescribe **Tuberculinum 200, 1 single dose.**

See also
Presentation of Pulsatilla

Follow up after 2 months – His mother complained that whatever he wants the parents have to give it immediately (bossy). He would punch the cupboard when angry. He does many things but leaves things unfinished. He used to spend at least 8 hours a day on social media. He would break things unknowingly. His room was always messy. Now he wanted to drop out of commerce stream and join computers (changeable). He was angry with himself for not achieving or having purpose in his life. There were several conflicts with his father. When he gets angry, he is afraid of killing someone. I selected **Sulphur 10M, 1 dose**. Sulphur is a complementary medicine to Tuberculinum.

Follow up after 7 months– He was better for nearly for 6 months. He stopped the antidepressant medication within a month. However, three weeks back he tried to hang himself with a bedsheet but suddenly stopped himself saying 'I have to prove myself to the world'.

He appeared very slim as he had reduced from 93kgs to 73kgs by running 10 kms every day. Even if he suffered cramps he wouldn't stop. He would read many self help books to improve himself.

He stopped social media, as he wanted to live in the real world. He said that universities cannot provide any knowledge to him, and that he can learn simply by reading in his library. However, his concentration had diminished while reading and he had to read the same matter over and over again and still didn't understand it.

The last 3 weeks he was crying a lot out of anger. He loves to sit by himself alone. He said that his mind had twice the thoughts of a normal person and that made him very intuitive. He said, "If anyone tries to offend me I will fuck him in such a way that the person won't even realize who did it".

He wanted to manipulate everyone. He wanted to play mind games to win the confidence of his parents so that they give him the car to drive. He was brought to homoeopathic treatment by his uncle who was sitting outside.

The patient told me "I can kill my uncle and feel nothing about it." He had broken a chair at home 3 days ago. He complained of insomnia and tachycardia 150/m and said that the ADHD medications were responsible for it (researched by him).

See also
Formica Rufa - A Case of Anxiety and Insomnia

He craved for a lot of coffee which calmed him down. There was such a rage on his face (almost like a hard-core criminal). He felt impulses to murder people as he went for his morning run. I prescribed him **Nux Vomica 50 M, 1 dose** based on inclination

Follow up after 1 month– He appeared so calm and cool. No suicidal thoughts at all. He would not run 10 kms at 6am because now he began experiencing fatigue. Exercise which was not so important to maintain his mood anymore. On his own he stopped the ADHD medicines which corrected his tachycardia.

Now he can sleep earlier and wake up late in the morning. His mother was more relaxed since there was no aggressive behavior at home with his father. In fact, there were minimal quarrels. His mind did not have racing thoughts. No remedy was needed.

This case demonstrates how timely judicious use of antimiasmatic remedies in a certain sequence is essential to restore harmony. We began the treatment with the anti-syphilitic remedy Aurum Met because this case had a lot of deep miasmatic load clearly evident in his family history of illnesses.

This was followed by Tuberculinum since he was by nature very nasty, malicious due to discontentment, provocative and highly manipulative. Tuberculinum also covered his fear of animals (dogs) and desire for ice cream.

He also had addictive behavior with desire for things harmful to him. His changeability of mind was seen in his academics. I further supported him with two antipsoric remedies, Sulphur and Nux-Vomica based on indications.

Nux Vomica did the greatest good by calming him down, normalizing his sleep and cancelling the bad effects of medications which were arousing the mind of the patient instead of calming it down. Higher potencies were used in this case because the susceptibility was higher, the presence of ample of characteristics and on account of the violent nature of the disease.

Follow up after 3 months

Two months ago (August 2020) his mother who is a nurse suffered from Covid 19, his father and sister both got affected, except him. He is very stable in mind and says that he is fully self-sufficient and not needing any medical treatment. He advocates homoeopathic treatment to others. His mother recovered but his sister is not doing so well. He worries about her since she is showing some signs of mental illness. He has no active problem. He drives the car wherever his mother wishes to

Acute Infective Osteoarthritis in a Woman of 70

June 17, 2022 • Add Comment • by Rajiv Peres

Dr. Rajiv Peres shares a case of acute infective osteoarthritis in a woman of 70. Shifting pains and aggravation at night, along with astute analysis by Dr. Peres led to the simillimum.

Name: LD

Female, Age 70

Has 2 daughters, one who is unmarried lives with her.

Background history —

I first saw this patient in May 2020. She appeared lean, thin, shy and presented as a case of acidity with retrosternal pain before food, aggravated by spicy and oily things, also worse by eating butter and masala items.

She had gall bladder polyps since many years.

She also complained of sleeplessness which dated back to depression since about 4

RESEARCH VETERINARY

She was worried how to bring up her two daughters. One is already married and she has a granddaughter.

In Dec 2019 she developed right tonsillar cyst. Right tonsillectomy done.

History of Recurrent sinusitis. She also complained of pain in right ear which comes suddenly and disappears slowly.

She used to get pain in the right knee < ascending, locking of right knee joint and was advised total knee replacement. Also, she suffered from numbness of feet which improved by walking about.

She was an emotional person and didn't want to complain much. She was afraid to be alone and afraid of thieves, when her unmarried daughter goes to work. Feels better with consolation. She craved coffee.

Rx Pulsatilla 200, 1 single dose

In August 2020 at follow up, she reported that only the acidity was mildly improved but otherwise no improvement from the remedy. I observed that her gait was like a duck. Also, she had stiffness of back while rising up in the morning. She had difficulty in ascending stairs. There was constant worry about her daughter. She had marked craving for cheese.

Rx Calcarea Carb 200, 1 single dose

Polyps still persisted despite Rx.

Present complaint:

RESEARCH VETERINARY

Since 14thth June 2021 she had very severe acidity after lunch which she has at 1.30 pm. Lunch includes 3 tablespoons of Kanji, then 15 minutes later, upper G.I discomfort started. Burning commenced at 2.15pm. At 6.15pm again burning increased for a few minutes and then she got relief. At 9.30 pm she had plain water and again burning started.

See also
Answers to April Case Quizzes

On 16th June 2021 her right knee started hurting, relieved by cold compresses, unable to sit on commode and couldn't even tolerate cold compress as it was raining very heavily.

This was an acute crisis as narrated by the daughter over the phone. Before I could go to see her, I asked the daughter to give her 3 doses of Lycopodium 200 on 16th June 2021. I was considering the problem originating in right knee and shifting to left knee. However, there was absolutely no relief but on the contrary her condition worsened day by day until she was completely limited to the bed. She was able to sit in bed but not stand. She could not eat anything. Pains were changing from right knee to left.

On 17th June 2021 she worsened, especially at night time

18th June 2021: Crying in pain which was unbearable now second knee (left) started

RESEARCH VETERINARY

That was when I went for a home visit. No orthopedic doctor was willing to make a home visit due to Covid19 scenario.

18th Evening a home visit. Patient was lying in bed on her back, all surroundings very clean. The left knee was massively enlarged (3 times bigger than the left), venous engorgement seen and hot to touch. She was not in a position to bend it. Would not like any pressure.

Right knee was also warm on touch but 3 times less swollen as compared to the left. The excruciating pains would be worsened at night preventing her from sleeping. Unable to stand at all. Weeping while telling the symptoms.

Daytime she feels hot and at night she felt chills in the body. Only able to sit up in bed. Can't even sit on the commode without help of daughter. Ailment from could not be traced.

There was fullness of abdomen with mild nausea feeling with fear. Fear was due to the burning in epigastrium triggered by any kind of food including beverages like coffee, tea and even water. She was always aggravated after eating and had sour eructations. Afraid to eat. Also, it was observed by the patient that even in summer she had icy cold sweat. At present not much sweating.

After I examined her joints, she began complaining of pain in throat. On examination of throat: Septic tonsillitis of left side and the uvula was massively swollen pale and had a whitish tip pointing downward (like icicles). She was prone to such septic lesions even in the past. Patient was asked what was troubling her the most? She said left knee pain. I inquired "What about your acidity?" She said it is hardly troubling her at present.

Mastitis in a Woman of 30

Diagnosis : **Acute infective osteoarthritis secondary to septic tonsillitis**.

Rx: Kali Bichromium LM1 Twice a day for 2 days **–** prescribed on 20th June 2021.

Reasons for prescribing Kali Bichromium;

1) I referred to Boger's synoptic key initial repertory section page 48 for shifting pains rubric

2) I used night aggravation (syphilitic) to eliminate remedies. I was left with Pulsatilla, Ledum Pal and Kali-Bi. Pulsatilla had been tried in the past but without any success. Ledum Pal has coldness of parts better by cold application, whereas in this case the affected part is warm to touch and better by cold application.

I read all these 3 drugs from Materia Medica and in Allen's Keynotes under Kali Bi. I found the PQRS symptom of this case Oedematous, bladder-like appearance of uvula.

Follow up on 21st June.

In the morning she first experienced some vertigo and then began walking by holding the walls. Vertigo was an old symptom that had returned after the remedy.

22nd June : Able to walk without any support

Home visit Follow up on 10th July. Patient walking absolutely normally. Both knees were cold on touch and appeared symmetrical in contour.

Follow up on 22nd August 2021

She came walking to my clinic with lots of gifts for me. No complaints of knee pains, walks well. Both knees cold on touch, no tenderness. On examination of throat: Bladder like swelling of uvula restored back to normal as can be observed in the photograph. Sleeps well. Eats well. Blood pressure 130/80mmHg.

This case highlights the role of the homoeopath at the bedside and how the whole phenomenon has to be perceived in resolving chronic diseases.

Uvula Aug 22nd after Kali Bi

Knees – Aug 22nd

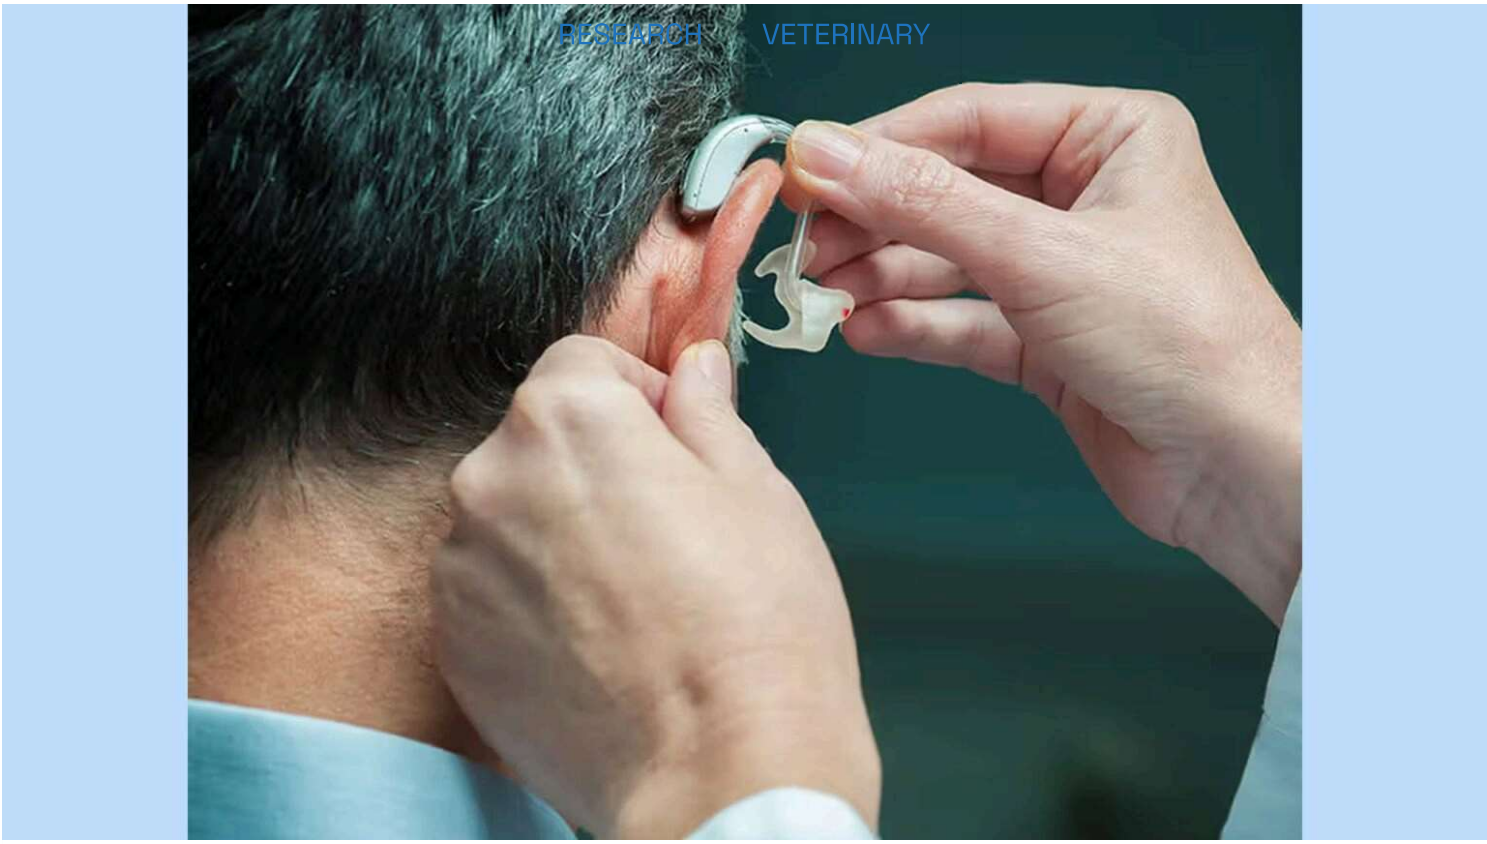
Right Sided Hearing Impairment Post Covid

August 17, 2022 • 1 Comment • by Rajiv Peres



Dr. Rajiv Peres shares a case of post-Covid hearing impairment in a woman of 50. Ailments from embarrassment and sleepless before midnight due to flood of thoughts were symptoms leading to the simillimum.

30th December 2020: A 50- year-old married lady, mother of three children and a college teacher by profession presented with complaint of blocked feeling in right ear, with hearing impairment of right ear since 8th November 2020. No history of pain in right ear. This was an ailment from covid infection which she suffered on 8th November 2020.

She had fever for two days, body ache for 4 days and cough for 15 days. She did not take any treatment for it. However, post covid she never felt fully recovered. Past history of old ear perforation in right ear. Usually, such perforations heal

RESEARCH VETERINARY

Family history: Father expired due to myocardial infarction age 51
Mother suffers from hypertension and cervical spondylosis
Paternal grandfather died of stomach cancer
Paternal grandmother had diabetes mellitus
Maternal Grand Father died due to cancer of lung
Mother's side – 3 Aunts died of cancer
Elder sister suffers from hypothyroidism
Younger sister suffers from S.L.E

Considering that the cold had settled in the ear, I prescribed **Kali-Sulph 1M**, 1 dose as an acute remedy.

Follow up end of January 2021: No relief in blocked feeling in right ear with hearing impairment, Confusion of mind also not improved. No medicine was prescribed but patient was advised to visit an ear specialist.

Follow up on 19th June 2021– Patient was informed by the ear specialist in February that there is nothing wrong with the right ear and that her hearing should return in a few weeks. As per the audiogram, the right ear had mild conductive hearing loss. The rest was all within normal limits.

She complained of upper backache, better by stretching, worse by leaning forward while sitting. No menses for last 4 months. USG abdomen showed uterine polyps. She also had a peculiar sensitivity: whenever she killed an ant her eyes would itch a lot. She feels worse after eating mushrooms since the birth of her third child. She was feeling tired easily.

See also
Psoriasis in a Man of 63

I considered giving her the chronic remedy which usually helps her. Hb=9.8 ESR=28. Prescription was **China 200**, 1 single dose

Follow up on 19th October 2021– This time patient presented with two complaints; first was relapse of trigeminal neuralgia in right side of mouth. Also, ailments from eating sour things and from mental overexertion.

Pain worse at night, worse by touch of tongue, worse by talking. There was a program in college in which she had be a moderator and she spent some sleepless nights in anticipation. Shifting pain come and disappear suddenly. Worse on beginning to speak, or when brushing teeth or also while eating.

She felt the need to move continuously. Wants to be alone only with her children and husband. Her disposition had changed from a usually very quiet, gentle, shy lady into an irritable person. She would go to bed late due to tension.

Her college authorities were harassing her and her husband for not taking Covid vaccinations. Both are teachers and were forced to do a RTPCR test every week. They were embarrassed by the higher authorities and threatened that their salary would be stopped.

She was not convinced about the concept of this vaccine because a number of people she knew had suffered side effects of vaccination. Her eldest son is a

Due to her son's condition, she remains house bound. She is also embarrassed to go around with him because he gets very violent at times and beats both parents. Although this lady is only 50 years old, her hair is completely white making her look as if she is 70 years old.

See also
A Case of Acne Rosacea

Also the hearing impairment bothered her a lot during her classes as she could not listen to the queries of her students. She would feel very embarrassed. It was almost one year since she suffered from Covid and still the hearing impairment continued.

Her other complaint was numbness in her right hand, worse while writing. She would forget names of her favourite students which hadn't happened before.

I reviewed the case thoroughly since a remedy like China that had helped her previously, had failed to register and effect a cure. I knew that this case needed a far deeper acting remedy and secondly that this medicine should cover hearing loss without organic disease.

I repertorised this case using the following Rubrics: 1) Ailments from embrarassment 2) Sleepless before midnight because of flood of thoughts.

I read materia medicas. Allen's Keynotes: " nerves "worn out", after business embarrassments, unable to sleep.

RESEARCH VETERINARY

Boger writes: early senility, symptoms suddenly change place, bashful so can't have others present. Dunham says: complaints from excitement. Emotional in extreme. Intense people. Numbness of limb laid on. The more they think about their sensations the greater they become. Slow memory, slow comprehension. Confusion of mind in presence of strangers. Itching that is neurotic, meaning the more she scratched the more it itches. Dr Luc writes: Impaired hearing in elderly without any organic defect of the ear.

Oct 19, 2021 –Ambra Grisea 200 (indicated nosode), 1 single dose.

Follow up on 11th February 2022– After the remedy given on 19th October 2021 the right sided hearing impairment was completely gone. Shifting pain in jaw absent. Feels upper backache only if she carries a lot of weight. No remedy given.

This case teaches us how to perceive the whole phenomena (Aphorism 8 Organon of Medicine) otherwise we shall not be able to restore the sick to health.

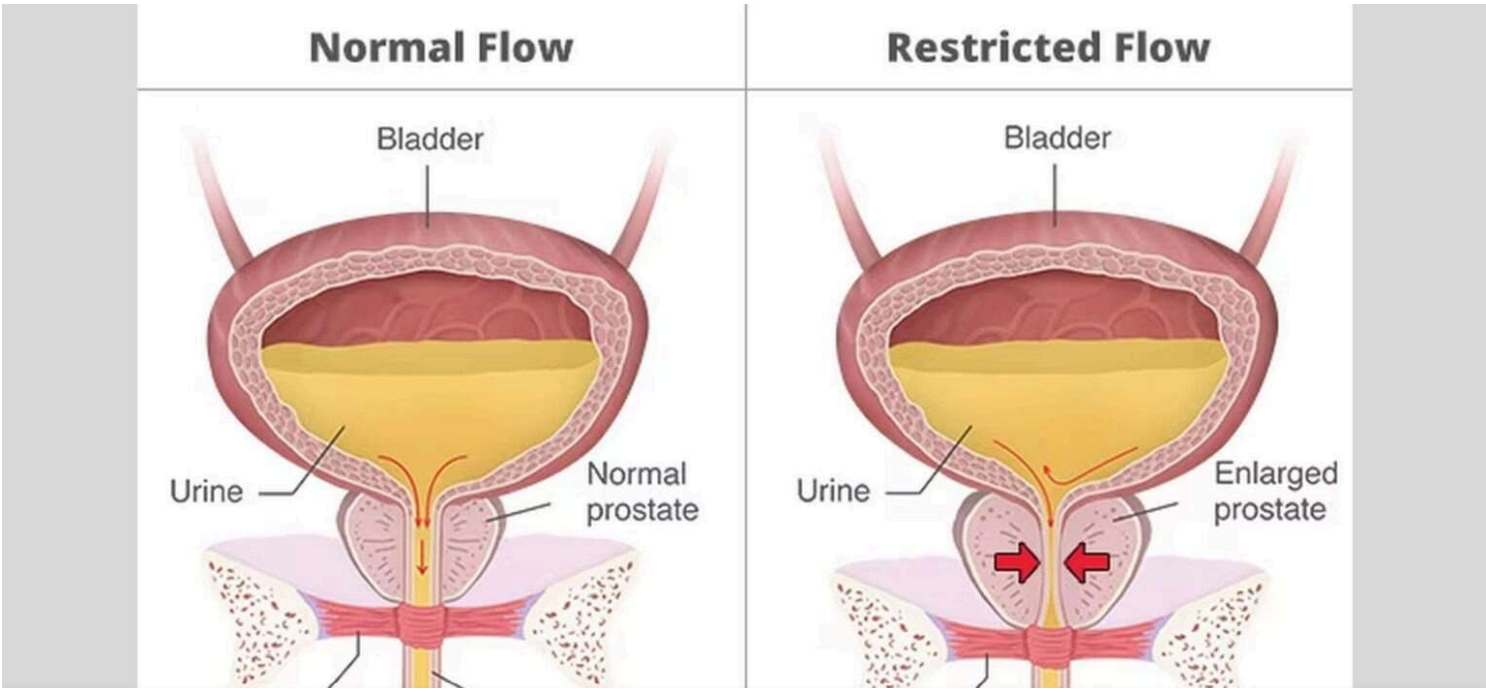
Urine Retention in a Man of 79

October 17, 2022 • 1 Comment • by Rajiv Peres



Dr. Rajiv Peres shares a case of urine retention in a man of 79. Enlarged prostate, urine drop by drop and micturition interrupted were among the symptoms leading to the simillimum.

Name: Mr. F. A

Age: 79 Years

Date of Case Taking: Feb 12, 2022

Probable Clinical Diagnosis: Acute urine retention secondary to prostatomegaly. (revealed on USG and 3 storage symptoms: frequency, urgency & nocturia)

On February 12, 2022 this 79 year old man was brought to my clinic by his daughter in law at 7pm. He was a known case of diabetes mellitus for the last 30 years. He complained that he was not able to pass urine for the last 2-3 days. He carried with him a USG report ordered by another doctor on the same day which stated that he had prostatomegaly.

His lower abdomen was massively distended and he was finding it difficult to breathe normally. He complained of stinging pain during micturition. He was able to pass only 2-3 drops. He also suffered from fever since the afternoon of the same day.

His problem of frequent urination was aggravated at midnight to 12.30am. He was able to pass urine only on standing, in sitting he was not able to pass urine. He was afraid of drinking water due to no urination. He avoided eating food.

LOCATION	DURATION	MODALITIES
Lower urinary system Retention	Since last 2-3 days Stinging pain during micturition. Inability to pass urine with fully distended bladder. Passes only 3 drops then	<Night 12-12.30am Urination only in standing position. <sitting

Evaluation of Symptoms of Acute Totality

- Boger Boenninghausen's Repertory was used.

1. Prostate gland enlarged, swelled p. 429 (Causation) Calc-c, Con, Puls, Sabal, Staph, Sulph
2. Urination drop by drop (strangury) p.435 Calc-c, Con, Puls, Staph, Sulph
3. Micturition interrupted p. 437 Con, Puls, Sulph, Sabal
4. From my knowledge of Materia Medica this modality "Can urinate only when standing" (Con, Sars)

See also
Depression

Materia Medica References for Conium

1. Allen's Key notes- Great difficulty in voiding urine; flow intermits; prostatic affections p.93
2. Boger's synoptic key- Urine stops and starts; >standing. Prostatic dribble p. 178
3. Vermeulen's Concordant Materia Medica- Frequent urination at night. Feeling of pressure on the bladder. Much difficulty in voiding. Dribbling in older men. pg360

Other remedies that repertorized out:

- **Sabal Serrulata-** There has to be constant desire to pass urine at night. Cystitis from prostate enlargement. Sediment in urine. Starting flow of urine is difficult and painful. Paresis of bladder sphincter; incontinence on exertion like lifting & laughing, absent in our case.
- **Pulsatilla**– Spasmodic pains in bladder after urination. Urine dribbles when emotionally upset. Urging to urinate on lying on back. Interrupted flow. Haematuria after urination, absent in our case.
- **Sarsaparilla**– Severe smarting at last drop (conclusion) of urine.

- **Staphysagria**– Important for cystitis in young married women. There is pressure upon the bladder, feels it did not empty. Patient urinates in thin stream or drop by drop. Burning in urethra when not urinating, absent in our case.

Note: Sarsaparilla was eliminated because there were no sediments in urine, nor there was smarting at conclusion of urination. Pulsatilla was eliminated since there was no emotional element involved anywhere in the case. Staphysagria was ruled out since there was no burning when not urinating. Sabal serrulata was also not given because this is not a case of paresis of bladder sphincter.

See also
Suspected Enteric Fever in a Man of 65

Final Prescription dated 12 February 2022

- **Conium Maculatum LM 0/3, 8 drops every hour**.

Potency Selection

- Here we have an old man with enlarged prostate with not many characteristics hence the LM scale was considered. One hourly repetition was considered because this case is an acute emergency and repetition alone can stimulate the response in this old patient with low susceptibility.
- Later on LM 6 was given (8-3-22).
- He was only on anti-diabetic medications and no other medicines.

VETERINARY

VETERINARY

Recent Investigations in August 2022

VETERINARY

Lessons

- This case taught me that catheterization is not the only way out in a case of sudden urine retention. We learn by facing such emergencies with

- LM potencies helped to not only restore the flow of urine, but also to reduce the size of his prostate by half in less than a month's time.
- The most recent USG report repeated 6 months later suggests increase in dimensions of prostate gland along with volume. Although symptomatically the patient is doing well, this treatment may not have been curative but palliative in nature.

November 11, 2022 at 9:18 am

Thank you Dr Peres, this case gives me hope in getting a good outcome for urine retention. I tried to help a client male 70yrs who was already catheterised and waiting for prostate surgery to reduce the size of the prostate. This surgery has been performed for him 7 years prior. In his case he had a blocked catheter tube and he was back in hospital and then re-catheterised while on a wait list. I use bioregulatory medicine – HEEL remedies. I did try Sabal, as well as some indicated herbal remedies. Also used 30C Chimaphila initially. Perhaps the potency was too low, but seemed well indicated. The problem was because he was catheterised it was impossible to tell if the remedy was working. This patient had also become dehydrated because he was afraid of drinking. Once he started the remedies he felt more secure to drink and this was also after he was recatheterised and his urine flow was unimpeded. I think that he was not educated appropriately after his first episode of enlarged prostate, and the drivers for the growth were never addressed. I am a naturopath and tried my best for this client. He says he will return once he has his surgery. Being catheterised for months while waiting for surgery is fraught. This is supposed to be a first world health system. In his case he should have been treated as urgent to prevent further harm. Your case gives me hope. thanks for sharing.

ABSTRACT

Molluscum contagiosum is a common cutaneous viral infection in children. It is a benign but nonetheless frequently troublesome viral infection that generally affects young children. Many studies have shown that, it comprises nearly 1% of all the skin diseases and its incidence has increased nearly fourfold during past twenty years.
Homoeopathy has excellent scope in the treatment of molluscum contagiosum. The treatment is targeted towards the root of the illness and hence homoeopathy brings about lasting cure rather than temporary relief.

OBJECTIVES

To study safe and effective treatment of *Molluscum Contagiosum* without any side effects.

Keywords

Benign, Molluscum contagiosum,Homoeopathy,*silicea.*

INTRODUCTION

Skin is the largest organ of the body and it forms about sixteen percent of its total mass. It is connecting link between the internal organs and the outer world.
Molluscum contagiosum is one among them caused due to *molluscum contagiosum virus (MCV)*. It commonly affects the children. Many studies have shown that, it comprises nearly 1% of all the skin diseases and its incidence has increased nearly fourfold during past twenty years.
Molluscum contagiosum being a contagious disease, it poses embarrassment for school attending children. Cosmetic purpose is another important reason for which treatment is sort.
Though *Molluscum contagiosum* is self limiting disease, some patients may develop complications, such as secondary bacterial infection, chronic conjunctivitis and punctuate keratitis. Hence treatment is needed to prevent above said complications

Conventional mode of treatment is curettage or cryosurgery which has to be done repeatedly. Moreover the utility of curettage and cryosurgery is limited when the lesions are too small and too many. Formation of scar as a sequel of such treatment is high.
In this study, I have made a sincere attempt to understand the essential nature of *molluscum contagiosum*,

its different manifestation and homoeopathic approach, which is not been done systematically so far. Hence there is need to study in detail the effectiveness of homoeopathic treatment of *molluscum contagiosum* in pediatric age group.

SKIN

Skin and its accessory structures – hair and nails, along with various glands, muscles, and nerves – make up the ***integumentary system***. ***Dermatology*** is the medical specialty that deals with the diagnosis and treatment of integumentary system disorders.[50]

Skin covers the entire external surface of the body, including the external auditory meatus, the lateral aspect of the tympanic membrane and the vestibule of the nose. It is continuous with the mucosae of the alimentary, respiratory and urogenital tracts at their respective orifices, where the specialized skin of mucocutaneous junctions is present. It also fuses with the conjunctiva at the margins of the eyelids, and with the lining of the lachrymal canaliculi at the lachrymal puncta.[46] It is the largest organ of the body in both surface area and weight.[50]

FUNCTIONS OF SKIN

The integumentary system contributes to homeostasis by protecting the body and helping regulate body temperature. It also allows you to sense pleasurable, painful, and other stimuli in your external environment.

The integumentary system helps maintain a constant body temperature, protects the body, and provides sensory information about the surrounding environment. Of all the body‘s organs, none is more easily inspected or more exposed to infection, disease, and injury than the skin. Although its location makes it vulnerable to damage from trauma, sunlight, microbes, and pollutants in the environment, the skin‘s protective features ward off such damage. Because of its visibility, skin reflects our emotions (frowning, blushing) and some aspects of normal physiology (such as sweating). Changes in skin colour may also indicate homeostatic imbalances in the body. For example, the bluish skin colour associated with hypoxia (oxygen deficiency at the tissue level) is one sign of heart failure as well as other disorders. Abnormal skin eruptions or rashes such as chickenpox, cold sores, or measles may reveal systemic infections or diseases of internal organs, while other conditions, such as warts, age spots, or pimples, may involve the skin alone. So important is the skin to self-image that many people spend a great deal of time and money to restore it to a more normal or youthful appearance.

The numerous functions of the integumentary system (mainly the skin) include thermoregulation, storage of blood, protection, cutaneous sensations, excretion and absorption, and synthesis of vitamin D.

DIAGNOSIS OF SKIN DISORDERS

The key to successful treatment is an accurate diagnosis. Keen eyes and a magnifying glass are all that are needed for a complete examination of the skin. Sometimes it is best to examine the patient briefly before obtaining a full history: a quick look will often prompt the right questions. However, a careful history is important in every case, as is the intelligent use of the laboratory.

HISTORY

The key points to be covered in the history should include descriptions of the events surrounding the onset of the skin lesions, of the progression of individual lesions, and of the disease in general, including any responses to treatment. Many patients try a few salves before seeing a physician. Some try all the medications in their medicine cabinets, many of which can aggravate the problem. A careful inquiry into drugs taken for other conditions is often useful. Ask also about previous skin disorders, occupation, hobbies and disorders in the family.

EXAMINATION

To examine the skin properly, the lighting must be uniform and bright. Daylight is best. The patient should usually undress so that the whole skin can be examined, although sometimes this is neither desirable nor possible. The presence of a chaperone, ideally a nurse or a relative, is often sensible, and is essential if examination of the genitalia is necessary.

DISTRIBUTION AND MORPHOLOGY

A dermatological diagnosis is based both on the distribution of lesions and on their morphology and configuration. See if the skin disease is localized, universal or symmetrical. Note negative as well as positive findings. Always keep your eyes open for incidental skin cancers which the patient may have ignored.
After the distribution has been noted, next define the morphology of the primary lesions. Many skin diseases have a characteristic morphology, but scratching, ulceration and other events can change this. The rule is to find an early or _primary' lesion and to inspect it closely. What is its shape? What is its size? What is its colour? What are its margins like? What are the surface characteristics? What does it feel like? Most types of primary lesion have one name if small, and a different one if large.

There are many reasons why you should describe skin diseases properly.

Skin disorders are often grouped by their morphology. Once the morphology is clear, a differential diagnosis comes easily to mind.

If you have to describe a condition accurately, you will have to look at it carefully.

You can paint a verbal picture if you have to refer the patient for another opinion.[26]

TERMINOLOGY OF LESIONS

Primary lesions
Primary lesions of the skin can be categorised under following types,
Flat lesions

- *Macule*: a small (<1cm), circumscribed area of colour change without elevation or depression of the skin.
- *Patch*: a larger (>1cm) area of colour change without skin elevation or depression.
- Elevated lesions

- Solid lesions
    - *Papules* (<0.5 cm in diameter).
    - *Nodules* (>0.5 cm in diameter).
    - *Wheals*: pink, rounded, or flat-topped elevations due to edema in the skin.
    - *Plaques*: plateau-shaped structures often formed by the coalescence of papules.
- Fluid-filled lesions
    - *Vesicles*: <0.5 cm in diameter and filled with serous or clear fluid.
    - *Bullae*: 0.5 cm in diameter and typically filled with serous or clear fluid.
    - *Pustules*: <0.5 cm in diameter and filled with purulent material.[26,32]
    - *Abscess*: Localized collection of pus in a cavity, more than 1 cm in diameter. Abscesses are usually nodules, and the term _purulent bulla' is sometimes used to describe a pus-filled blister that is situated on top of the skin rather than within it.[26]
    - *Cysts*: 0.5 cm in diameter; represent sacs containing fluid or semisolid material (Unlike in bullae, the material within a cyst is not visible from the surface).

- Depressed lesions
    - *Erosions*: superficial loss of epidermis with a moist base.
    - *Ulcers*: deeper lesions extending into the dermis or below.

Other lesions

- *Erythema* is redness caused by vascular dilatation.
- *Angioedema* is a diffuse swelling caused by oedema extending to the subcutaneous tissue.
- *Tumour* is harder to define as the term is based more correctly on microscopic pathology than on clinical morphology. We keep it here as a convenient term to describe an enlargement of the tissues by normal or pathological material or cells that form a mass, usually more than 1 cm in diameter. Because the word _tumour' can scare patients, tumours may courteously be called _large nodules', especially if they are not malignant.
- *Papilloma* is a nipple-like projection from the skin.
- *Petechiae* are pinhead-sized macules of blood in the skin.
- The term *purpura* describes a larger macule or papule of blood in the skin. Such blood filled lesions do not blanch if a glass lens is pushed against them (diascopy).
- *Ecchymosis* is a larger extravasation of blood into the skin.
- *Haematoma* is a swelling from gross bleeding.
- *Burrow* is a linear or curvilinear papule, with some scaling, caused by a scabies mite.
- *Comedo* is a plug of greasy keratin wedged in a dilated pilosebaceous orifice.

  Open comedones are blackheads. The follicle opening of a closed comedo is nearly covered over by skin so that it looks like a pinhead-sized, ivory-coloured papule.
- *Telangiectasia* is the visible dilatation of small cutaneous blood vessels.
- *Poikiloderma* is a combination of atrophy, reticulate hyperpigmentation and telangiectasia.

Secondary lesions

These evolve from primary lesions.

- *Scale* is a flake arising from the horny layer.
- *Keratosis* is a horn-like thickening of the stratum corneum.[26]
- *Crust* may look like a scale, but is composed of dried blood or tissue fluid.[26, 32]
- *Ulcer* is an area of skin from which the whole of the epidermis and at least the upper part of the dermis has been lost. Ulcers may extend into subcutaneous fat, and heal with scarring.
- *Erosion* is an area of skin denuded by a complete or partial loss of only the epidermis. Erosions heal without scarring.
- *Excoriation* is an ulcer or erosion produced by scratching.
- *Fissure* is a slit in the skin.

Sinus is a cavity or channel that permits the escape of pus or fluid.

- *Scar* is a result of healing, where normal structures are permanently replaced by fibrous tissue.
- *Atrophy* is a thinning of skin caused by diminution of the epidermis, dermis or subcutaneous fat. When the epidermis is atrophic it may crinkle like cigarette paper, appear thin and

translucent, and lose normal surface markings. Blood vessels may be easy to see in both epidermal and dermal atrophy.[26]

- *Lichenification* is an area of thickened skin with increased markings.[27,32]
- *Stria* (stretch mark) is a streak-like linear atrophic pink, purple or white lesion of the skin caused by changes in the connective tissue.
- *Pigmentation*, either more or less than surrounding skin, can develop after lesions heal.

Having identified the lesions as primary or secondary, adjectives can be used to describe them in terms of their other features.

- Colour (e.g. salmon-pink, lilac, violet).
- Sharpness of edge (e.g. well-defined, ill-defined).
- Surface contour (e.g. dome-shaped, umbilicated, spire-like).
- Geometric shape (e.g. nummular, oval, irregular, like the coast of Maine).
- Texture (e.g. rough, silky, smooth, hard).
- Smell (e.g. foul-smelling).
- Temperature (e.g. hot, warm).

Dermatologists also use a few special adjectives which warrant definition.

- *Nummular* means round or coin-like.
- *Annular* means ring-like.
- *Circinate* means circular.
- *Arcuate* means curved.
- *Discoid* means disc-like.
- *Gyrate* means wave-like.
- *Retiform* and *reticulate* mean net-like.

Configuration

After unravelling the primary and secondary lesions, look for arrangements and Configurations that can be, for example, discrete, confluent, grouped, annular, arcuate or dermatomal. Note that while individual lesions may be annular, several individual lesions may arrange themselves into an annular configuration. Terms like annular, and other adjectives discussed under the morphology of individual lesions, can apply to their groupings too. The Koebner or isomorphic phenomenon is the induction of skin lesions by, and at the site of, trauma such as scratch marks or operative incisions.

Special tools and techniques

A special diagnostic tools and techniques can be used to diagnosis the skin conditions, such as *magnifying lens, wood's light, diascopy, photography and dermatoscope.*[26]

MOLLUSCUM CONTAGIOSUM

DEFINITION

Molluscum contagiosum is a common cutaneous viral infection in children. It is caused by infection with a DNA virus of the *Molluscipoxvirus* genus.[27,43,48]

The word Molluscum contagiosum comes from the Latin word named *MOLLUSCUS* means SOFT characterised by pea sized semiglobular pearl like lesion with minute central depression.[1]

It is a benign but nonetheless frequently troublesome viral infection that generally affects young children.[57]

SYNONYMS

Molluscum sebaceum; Molluscum epitheliale;[1,11] *Epithelioma contagiosum;* [1,11,15]

Epithelioma molluscum; [1,11] *Dimple wart.*[15]

HISTORY

Molluscum contagiosum is a cosmopolitan human disease; several reviews describe the disease and the virus.[16] Its characteristic appearance was first described in 1817 by Bateman, who labelled disorder ―molluscum‖, a common term then for pedunculated lesions, and described it as ―contagiosum‖ to signify its apparent transmissibility, which he felt was due to the ―milky fluid‖ which could be expressed from the lesions. He differentiated the infection from molluscum fibrosum (neurofibromatosis). In 1841, Henderson and Paterson each described in this fluid cellular elements with large intracytoplasmic inclusion bodies (subsequently termed Henderson-Paterson, or molluscum bodies), which they felt were responsible for causation and transmission of the diseases. Subsequent reports of transmission of infections to humans by direct inoculation of lesion material supported an infectious etiology. The findings of tiny ―elementary bodies‖ within the molluscum bodies by Lipschutz in 1911, and of disease transmission by a ―filterable agent‖ by Juliusberg in 1905 and Wile and Kingery in 1919, suggested viral agent.[16,24] In 1933 Goodpasture and Woodruff described the inclusions and elementary bodies of molluscum contagiosum compared with those of fowl pox and concluded that the etiologic agent was a poxvirus. Since 1980, this relatively inconsequential illness at times has occurred in patients with AIDS as a tormenting opportunistic infection, which in Western countries amounts to a 5% to 20% incidence among homosexual men with AIDS.[16]

AETIOLOGY

Molluscum contagiosum is caused by a large brick-shaped DNA poxvirus with an ultra structural resemblance to vaccinia virus.[56] It has features intermediate between the orthopox and parapox groups. It infects humans, causing characteristic skin papules. It cannot be grown in tissue culture or eggs, and, although not readily transmissible to laboratory animals, has been shown to produce typical changes on human skin cultured on immunoincompetent mice. Restriction endonuclease and PCR analyses of MCV DNA have identified two main types, MCV-1 and MCV-2, with two much rarer types, MCV-3 and MCV-4.[9,48] MCV-1 is more prevalent than MCV-2.[48]

Molluscum contagiosum is caused due to Exciting cause and categorized under individual acute disease. In this molluscum contagiosum virus acts as an exciting cause.

Large numbers of MCV particles can be extruded from skin lesions, and large amounts of viral DNA can readily be extracted from virions. MCV has not been grown in established cell cultures, but virus from skin lesions has been propagated in human foreskin xenografts. The recognition of MCV transcriptional control elements in genetically engineered vaccinia virus indicates that MCV has a replication strategy similar to

other poxviruses.
The MCV genome is a covalently closed, linear, double-stranded DNA of 190 kbp and 63% G+C. Restriction enzyme cleavage analysis of the DNAs of several hundred isolates from different parts of the world initially suggested two genome subtypes, subsequently a third, and recently a fourth, although the different DNAs cross-hybridize extensively by Southern blotting. The significance between restriction map differences and viral biologic differences is unknown; all DNA subtypes produce the same apparent disease.
Genomic DNA of MCV subtype I has been sequenced (GenBank No. U60315; 190,289 bp). Of 182 potential encoded proteins, 105 have homologs in variola virus DNA that are likely to be essential for virus replication based on correlation with known function orthopoxvirus proteins; however, MCV generally lacks corresponding sequences for proteins involved in immune surveillance and modulation. Of the 77 predicted MCV proteins without correlates in orthopoxviruses, 36 show potential to be host-interactive homologs. In vitro studies indicate these are isologs of cellular glutathione peroxidase,class I MHC protein, two apoptosis inhibitors, two polypeptides that bind IL-18, and a chemokine antagonist.[16]

EPIDEMIOLOGY

Molluscum contagiosum virus infection occurs worldwide and appear specific to humans.[57] Virus occurs throughout the world, most commonly causing disease in childhood. Type 1 MCV is found in the majority of infections (76–97%), and whilst there is no relationship between virus type and lesional morphology or anatomical distribution. The disease is common, but its incidence in most areas is not reliably known.[9]
It commonly affects children and sexually active adults as well as immunocompromised individuals.[51]
The disease is endemic with a higher incidence within institutions and communities where there is overcrowding, poor hygiene, and poverty.[22]
The incidence of disease is 2% to 8% in some populations and is more common among 10- to 12-year-old children in developed countries than in developing countries, such as Fiji and the DRC, where the peak incidence is reported between ages 2 and 3 years and 1 and 4 years, respectively. In New Guinea, a prevalence of 22% with an incidence of 6% in children younger than 10 years of age has been reported. The disease occurs sporadically, although it can become endemic, particularly in institutions such as children's day care or boarding schools, or in communities with poor hygiene and overcrowding. Contact transmission has occurred nosocomially, by tattooing, wrestling, or by swim team members sharing towels. Abundant lesions are common in atopic individuals who may acquire a patchy and irritable eczema around sites of infection known as eczema molluscatum. Genital molluscum sometimes coincides with other sexually acquired diseases, including AIDS, and may signal sexual abuse of a child; otherwise, children may acquire lesions on the arms, or most often, the upper torso.
The different DNA subtypes do not affect different body locations, as occurs in infections with human herpesviruses type 1 and 2. In one study of 261 patients, MCV subtypes I, II, and III were detected in a ratio of 226:32:3 (183). Usually, specimens from different parts of the body are the same DNA subtype as are isolates among contacts; however, on rare occasions, mixed infections have occurred. Genital MCV infection has recently become much more common based on studies in the United States and Great Britain.[16]

AGE

Molluscum contagiosum is more common in infants and children younger than 5 years of age.[32,42] Age of peak incidence is reported as between 2 and 5 years. The disease is rare under the age of 1 year, perhaps due to maternally transmitted immunity and a long incubation period.[9]

SEX

Molluscum contagiosum is more common in boys than in girls.[42]

PREDISPOSING FACTORS

1. Impaired cellular immunity.
2. HIV infected patients.[9,48]
3. Atopic dermatitis.[48,57]
4. Topical steroids and other topical immunomodulatory drugs.[9,51]

MODE OF INFECTION

1. By direct skin or mucous membrane contact.[9,16,20,57]
2. Bath towels, swimming pools, and turkish baths.
3. Individuals involved in close contact sports (e.g., wrestling).
4. Koebnerization.[57]
5. Indirectly by means of fomites by virus entry through breaks in the epidermis or in the infundibular portion of the hair follicle. [16,43,48]
6. Autoinoculation.[20,48,57]
7. Contact transmission has occurred nosocomially, by tattooing, wrestling, or by swim team members sharing towels.[2,16]
8. In hot countries where children are lightly dressed and in close contact with one another, spread within households is not uncommon.
9. Infection of children through sexual abuse is presumably possible. However, to a greater extent than warts, molluscum contagiosum is seen quite commonly on the genital, perineal and surrounding skin of children, and abuse should not be regarded as likely unless there are other suspicious features.[9]
10. Epidemiological studies suggest that transmission may be related to poor hygiene and climatic factors, such as warmth and humidity.[1]
11. Contact with contaminated objects, such as clothing or toys, etc.[22]

PATHOGENESIS AND PATHOLOGY

The typical molluscum contagiosum lesion consists of a localized mass of hypertrophied and hyperplastic epidermis extending down into the underlying dermis, without breaking the basement membrane and projecting above the adjacent skin as a visible tumour. There are increased mitotic figures in the germinal layer, above which are pathologic changes in the nuclei and cytoplasm. As the surface cells are approached, these lesions become more and more pronounced.[16]

Molluscum contagiosum virus (MCV) enters the basal keratinocyte and increases the rate of cell division to twice that of normal skin, probably by inhibition of normal keratinocyte apoptotic differentiation programmed by specific MCV encoded proteins. In prickle cell layer, mitosis declines as viral DNA synthesis increases. The cellular proliferation produces lobulated epidermal growths that compress the papillae until they appear as fibrous septa between the lobules. The basal layer remains intact. Each cell enlarges in size and the cytoplasm is filled with a large hyaline acidophilic granular mass known as molluscum bodies, which pushes the nucleus to the edge of the cell. These bodies are present in large number in the cavity which appear near the surface of the centre of a fully developed lesion.[15,24] Inflammatory changes in the dermis are absent or slight. But in lesions of long duration, there may be a chronic granulomatous infiltrate.[9,51]

Studies of Cellular kinetics demonstrated three distinct stages of evolution in growth; an early stage, in which epithelium nuclei divide, a middle stage, in which epithelium division diminishes, and a late

stage, in which dermal endothelial cells and fibroblasts becomes activated. Inflammatory cells may be present in all three stages.[42]

The core of the lesion consists of degenerating epidermal cells, with inclusion bodies, and keratin, which is produced by uninfected cells. Fully developed lesions are loculated, and there is little inflammatory reaction in the corium unless secondary bacterial infection has occurred. The tumour-like appearance of lesions is from hypertrophy of epidermal keratinocytes because of the presence of virus-packed inclusion bodies and hyperplasia of uninfected basal cells.

Lesions are relatively devoid of cells involved in the immune response, including NK and Langerhans cells, although T cells may be present in the perilesional dermis. Infected keratinocytes no longer display b2-microglobulin, possibly because of complexing in the endoplasmic reticulum between an MCV homolog of MHC glycoprotein and cellular b2-microglobulin. MCV does not appear to encode an epidermal growth factor homolog; however, intense staining of transferrin and EGF receptor has been observed on molluscum bodies, but not on surrounding uninfected keratinocytes. MCV appears to provoke little immunity; patients under immunosuppressive therapy, and some AIDS patients, may have widespread and recurrent lesions. The lesions are noteworthy for the absence of reactive cells, and virus- specific antibodies are demonstrable in about 70% of patients; many patients develop antibodies after treatment for MCV (e.g., curettage). Antibodies against MCV do not react with different poxvirus genera. Lesions may persist in some patients for as little as weeks or as long as 2 years, with no sign of inflammation, which may be an effect of an MCV chemokine antagonist. Repeated attacks are relatively common in situations in which opportunities exist for reinfection, such as in children's day care centres and among sexually promiscuous adults.[16]

Specific antibodies have been found in about 58–73% of patients with molluscum contagiosum, and, perhaps due to unrecognized infection, in about 6–16% of controls, but these have not been demonstrated to have a role in disease clearance.[9]

HISTOLOGY

Molluscum lesions are acanthomas consisting of hyperplastic and hypertrophied epidermal cells which proliferate in a downward fashion into the dermis. Cells are filled with intracytoplasmic inclusion bodies, so called Henderson-Paterson bodies, which are eosinophilic ovoid structures in the lower malphighian layer. In the upper epidermis, they become more basophilic and may be as large as 35 µm in diameter.[42]

- *Circumscribed multilobular epithelial proliferation* with central keratinisation.
- *Intracytoplasmic* inclusions, at the periphery eosinophilic and towards the centre of the tumor more basophilic.
- Associated mixed or lymphocytic infiltrate.
- Occasionally lymphocytes are activated and enlarged.
- **Variant:** Molluscum contagiosum *folliculitis*: Involvement of follicular epithelia with inclusion bodies and associated mixed infiltrate.
- The histological changes are pathognomonic. When the inflammation is intense or in folliculitis, the inclusion bodies may initially be masked and the infiltrate mistaken for a lymphoma until deeper sections unearth the classic changes.[31]

CLINICAL FEATURES

1. The typical lesion of molluscum contagiosum are discrete, dome shaped, umbilicated waxy papules. [1,9,22,32,42]
2. They may be skin coloured, [2,9,22,42] pink or white. [1,9,20,32,42]
3. A small central punctum frequently is visible.[32,42]

4. If lesions are squeezed between the fingers, a cheesy or sebaceous-looking matter issues from the hilum.[1,13]
5. A lesion starts as a tiny papule and progresses to a size of 5–10mm in 6-12 weeks
6. Small lesions may join to form a plaque (_agminate form‘).[9,51]
7. Lesion may appear vesicular because of a translucent quality.
8. The size may vary from 1 to 5mm, few lesions can occur as large as 10 to 15 mm called as giant molluscum or molluscum contagiosum giganteum.[15,22,42]
9. Usually multiple. May be present in groups or may be widely disseminated on the skin and mucosal surfaces.[1]
10. They are rarely pedunculated (molluscum contagiosum pediculatum).[15]
11. Usually there is no itching or tenderness and no generalized symptoms.[22]
12. Lesions can occur anywhere on the body, but mostly on face, eyelids, neck, chest, axillae, sides of trunk, fold areas of extremities, and genitalia in children.[13,27,32] Palms and soles are rarely involved.[9,22,27]
13. After trauma, or spontaneously after several months, inflammatory changes result in suppuration, crusting and eventual destruction of the lesion.[9,20]
14. The disease usually lasts for 6 to 9 months,[9,14,41] but occasionally persisting for as long as 4 years.[9,14] Although individual lesions persist for only about 2 months.[9,41]
15. Lesions usually resolute spontaneously by forming erythema, pus and crusting.
16. Depressed scars or anetoderma-like lesions can remain when mollusca clear.[9]
17. Eczematous dermatitis occurs around the molluscum in 10% of cases known as molluscum dermatitis. [9,27,32]
18. In patient with chronic eczema or even atopic eczema, especially in areas of skin treated with glucocorticoids (local immune deficiency), hundreds of these mollusca contagiosa may develop: eczema molluscum.[15]
19. Multiple and widespread lesions are reported in atopic individuals and in immunosuppressed.[27,32]
20. Lesions on eyelids may produce conjunctivitis and/or keratitis.[9,27]
21. Usually not associated with sexual abuse or immunodeficiency in infants and children.
22. May occur as a sexually transmitted disease in sexually active adolescents and young adults.
23. Linear arrangement of lesions may be present, due to autoinoculation (Koebner phenomenon).[1,32]

DIAGNOSIS

1. The diagnosis of molluscum contagiosum is usually established on the basis of clinical appearance alone.[16,29,32]
2. Smears, made from the cheesy material expressed from the lesion is crushed between two slides and stained with Giemsa and Wright‘s stain show homogenous pear-shaped molluscum bodies. [2,16,27,32]
3. Skin biopsy reveals Henderson-Paterson bodies, which occasionally is used for large or atypical lesions.[27,32]
4. The distinctive umbilication can be seen more easily with a dermatoscope or after freezing.[9]
5. Demonstrating poxvirions by electron microscopy.
6. Diagnostic PCR methods are reported.
7. Occasionally, solitary lesions on the face or neck may be misdiagnosed clinically as basal cell

carcinoma.

8. Solitary tumours on the sole of the foot, although rare, also pose a clinical diagnostic problem.[16]

DIFFERENTIAL DIAGNOSIS

1. Varicella or Chickenpox. [24,29,42,57]
2. Verrucae or Plain warts.[15,24,32,51]
3. Juvenile xanthogranuloma.
4. Folliculitis.
5. Furunculosis.[42]
6. Lichen planus.[24,51]
7. Milia.[15,24,32]
8. Closed comedones.
9. Cryptococcosis.[24,32]
10. Syringomas.
11. Epithelial and intradermal nevi.
12. Sebaceous adenomas.
13. Histiocytomas.
14. Seborrheic and atopic dermatitis.
15. Basal cell epitheliomas.[24]
16. Genital herpes.[40]

COMPLICATIONS

1. Pruritus is sometimes a significant problem, particularly in those patients with underlying atopic dermatitis.
2. Chronic conjunctivitis and punctuate keratitis may develop in patient with eyelid lesions.
3. Secondary bacterial infection can occur, particularly if patients scratch their lesions.[57]
4. Eczematous patches often appear around mollusca.
5. Traumatized or over-treated lesions may become secondarily infected.[26]
6. Inflammation of molluscum contagiosum lesions is sometimes seen.[8]
7. Many a times though the skin has been cleared of the molluscum lesions, the core of the molluscum is not completely scraped off which can cause recurrence of this infection repeatedly.
8. Sometimes the cheesy matter in the centre of molluscum lesion gets infected with fungus, which spreads to all adjacent areas giving rise to white patchy discoloration and itching.

9. Recurrent molluscum can give rise to scarring, disfigurement and consequently mental trauma (Depression, low confidence in some cases).[40]

GENERAL MANAGEMENT

1. Avoid going to swimming pools, communal baths. [57]

2. Patients with Molluscum contagiosum should avoid sharing of personal items (eg, razors, bath towels) and contact with other fomites.[1,57]
3. Patients with Molluscum contagiosum should avoid scratching to prevent autoinoculation.
4. Obstetricians should be aware of the risk of vertical transmission of Molluscum contagiosum, and they should take precautions to prevent transmission during vaginal delivery.[1]

PREVENTION

- Prevention of spread may be enhanced by avoiding trauma to the site of involvement as well as avoiding scratching.
- Auto-inoculation may be decreased by treating existing lesions.[57]
- Chlorination of swimming pools.[5]
- One must refrain from squeezing or disturbing the lesion to prevent its spread.
- School children should not come in direct contact with infected child.
- Public toilets, swimming pools should be hygienically maintained.
- One must not share personal items of use such as towels, shaving blades, clothes, etc.
- Recurrent infections or skin lesions like eczema should be properly treated.[40]

TREATMENT

HOMOEOPATHIC CONCEPT OF TREATMENT

Homoeopathy has excellent scope in the treatment of molluscum contagiosum.[35,40] The treatment is targeted towards the root of the illness and hence homoeopathy brings about lasting cure rather than temporary relief.

Homoeopathic treatment not only helps in getting rid of the existing molluscum contagiosum but it also helps in removing the tendency for this condition to recur. Also the method of healing of the molluscum is without the use of any surgical aids and hence it helps in preventing scarring and other such side-effects that can occur due to surgery.[40]

Molluscum is predominantly *Sycotic* disease. So it requires an Anti-sycotic medicine to cure the case.[1,6]

In most cases the lesion disappears even without any treatment in a couple of months. However some lesions may persist for some time and require intervention. The drugs found useful in molluscum contagiosum include *Brom, Calc-ar, Calc, Kali-i, Sulph, Sil,* and *Thuj*. [1,20] *Calc* and ***Sil*** have been found very useful. After the correct dose of medicine, the lesions start disappearing after an inflammatory reaction with erythema and itching.[20]

Silicea as an internal remedy ranks first, and *Teucrium* next. *Bryonia, Bromine, Calc. Ars., Lycopodium, Nat. Mur.* and *Potass. iod.* complete the list.[13] Other remedies like *Sulphur, Thuja, Arsenicum, Iodum* are also beneficial.[17]

The question of ‗to treat or not to treat' becomes more complicated in patients with atopic dermatitis, who are at greater risk for secondary infection of the lesions. It is also challenging to treat the condition during swimming season because the lesions are known to spread in water.[30]

In §72 He says The diseases to which man is liable are either rapid morbid processes of the abnormally deranged vital force, which have a tendency of finish their course more or less quickly, but always in a moderate time-these are termed acute diseases; or they are diseases of such a character that, with small, often imperceptible beginnings, dynamically derange the living organism, each in its own peculiar manner , and cause it gradually to deviate from the healthy condition, in such a way that the automatic life energy, called vital force, whose office is to preserve the health, only opposes to them at the commencement and during their progress imperfect, unsuitable, useless resistance, but is unable of itself to extinguish them, but must helplessly suffer (them to spread and) it self to be ever more and more abnormally deranged, until at length the organism is destroyed; these are termed chronic disease. They are caused by infection with a chronic miasm.

J.H.Allen:

New growths are in themselves a life study; when I speak of new growths, I mean all of a benign or malignant origin; all are due to miasmatic origin and to miasmatic influence upon the life force. When we speak of new growths, we mean of course, false growth, abnormal growths, or falsifications in parts and organs of the body.

H.A.Roberts

In the secondary period of sycosis al most every disease that may arise takes on the inflammatory nature in some form; it may be acute, subacute or chronic. Sycotic manifestations are characterised by slowness of recoverySycosis never gives a true ulcer; the sycotic manifestations are more overgrowth of tissue than destructive of tissue. There are many warts and warty growths; these are sycotic signposts. The sycotic skin manifestations tend toward overgrowth or extra deposits pg230 232

Dr. Harimohan Choudhry:

Psora Vesicles of the itch- voluptuous, tickling, itching. Sycotic Wart and warty growths, sycotic manifestations are charecterised by slowness of recovery

Dr. Subrata Kumar Banerjea.

Vesicular eruptions are generally sycotic 122
Molluscum contagiosum(syco-psoric)123, 167
Vesicular eruptions which do not heal quickly are sycotic124
Sycosis has vesicular eruptions 153

Phyllis speight

Sycosis warty eruptions or growths.

MOLLUSCUM CONTAGIOSUM IN HOMOEOPATHIC LITERATURE

Clarke:

Clarke's Dictionary Of Practical Materia Medica.
A Dictionary of Practical Materia Medica
by John Henry Clarke M.D.
Molluscum contagiosum is seen in the clinical section of calcarea carb, silicea and sulphur.

Robin Murphy ND

Lotus Materia Medica. By Robin Murphy ND
Molluscum contagiosum is seen in the clinical section of, silicea and sulphur.

Rajan Sankran
Spirit of Homoeopathy
By Rajan Sankran
Interview with Dr. R. Sankaran by S.M. Gunavante Published in "The Homoeopathic Heritage", June 1990
Dr. Sarabhai Kapadia had a case of molluscum contagiosum. He took a full history, but could not get any characteristic symptoms. After an hour of taking the case, he saw the child scratching the head. The mother said that whenever the boy is sleepy, he does this. On the basis of Kent's Repertory: "Head: itching of scalp, sleep, when going to",
In section concomitants
Concomitants need not always be general symptoms. Sometimes, they are particular in a part of the body but have no pathological basis for their existence. My teacher successfully prescribed Agnus castus in the case of a child with molluscum contagiosum using the symptom "Itching of scalp when going to sleep". Dr. Sarabhai prescribed Agnus castus (perhaps 1M) and the molluscum disappeared soon, though the remedy does not cover the complaint.

HOMOEOPATHIC THERAPEUTICS

Some homeopathic medicines found to be efficacious in cases of Molluscum contagiosum are,

Belladonna

Fine complexion and delicate skin; dryness; bright redness; burning heat; throbbing pains; pains appear and disappear suddenly; wildly delirious, restless, sensitive, nervous; child jovial and entertaining when well but violent when sick.

- Red, inflamed molluscum.
- Burning of the skin, also felt by the hand and it continues to burn after touching the skin, as though a hot stove has been touched, very characteristic.
- Red, hot and shining redness of the skin, with dryness, and swelling of the parts.

Bromium

Hot patient; fatty, fair; great weakness and easily overheated then sweat profusely sensitive to drafts; glandular affinity; tremulous; better by eating; quarrelsome and/or friendly, cheerful and fairly happy.

- Molluscum commonly appear on face, arms and shoulders.
- Sensation of something being alive in the skin.
- Worse warmth or warm, damp weather.

Calcarea arsenicum

Chilly patient; anemic; tendency for epilepsy and nephritic conditions; infantile hepato-splenomegaly; restless, anxious and emotional child; dreads to be alone.

- Pearly eruptions.vesicular, small and shiny inappearance.[51]

Calcarea carbonica

Calcarea carbonica is an effective medicine for treating the molluscum contagiosum.[35]
These children are typically soft, over-fat, fair, chilly, and lethargic.[12] Children with red face, flabby muscles, who sweat easily and take cold readily in consequence. Large heads and abdomens; fontanelles and sutures open; bones soft, develop very slowly. Curvature of bones, especially spine and long bones; extremities crooked, deformed; bone irregularly developed. Head sweats profusely while sleeping, wetting pillow far around. Profuse perspiration, mostly on back of head and neck, or chest and upper part of body. Difficult and delayed dentition with characteristic head sweats, and open fontanelles. During either sickness or convalescence, great longing for eggs; craves indigestible things; aversion to meat.[3]
Obstinacy; slight mental effort produces hot head. Averse to work or exertion.

Apprehensive; Forgetful, confused, low-spirited. Warts on face and hands.[7]

Carcinosinum

Carcinosinum is indicated if the mental and emotional symptoms indicate it. Nevertheless, some physical signs are often seen in this remedy: the Molluscum contagiosum.[37,45]

Causticum

These are people who live with the feeling that they have a Damoclean sword hanging above their head. There has been a dramatic incident in their lives. For example, after a very difficult labor and birth, the infant is fearful, whimpering, and cries when others cry (out of compassion, since misfortune has befallen them). Indeed, these children live in constant fear that new worries will materialize. They cannot go to bed alone at night, they fear the dark, and are often afraid of dogs. We often observe weakness of some kind. These children also are late in learning to walk.
We may see paralysis following an injury at birth, or after convulsions or exposure to cold (for example, facial paralysis from cold). These children are sensitive to dry cold. A dry wind from the north always makes them hoarse, as does air conditioning: the throat burns with pain, and they prefer to drink ice-cold water.
Frequently, warts will be present, often small, widely scattered warts of the molluscum contagiosum type, or larger warts near the edge of the fingernails. These children may stutter or pronounce words poorly, which often earns them some visits to the speech therapist. At times dictatorial, they can play on their weakness in order to maintain those around them under their domination. Finally, we may observe enuresis (involuntary urination). The child is inclined to wet the bed during the first hours of sleep at night, and may also urinate involuntarily at times when coughing or running.[19]

Dulcamara

Chilly patient, with skin affections brought on or worse by exposure to cold, damp, rainy weather; restless and irritable.

- Ailments after taking bath in swimming pool.
- Humid eruptions on face, genitals, hands etc.
- Flat, pearly eruptions.
- Worse cold in general, damp, rainy weather.[51]

Juglans cinerea

Dr. Paine (eclectic) says: "The Juglandin, as I have previously remarked, acts as a direct stimulant and tonic to the cutaneous surface; hence, I have used it in chronic eczema, herpes, pemphigus, rupia, acne, impetigo, ecthyma, lichen, prurigo, icthyosis, molluscum, and all other forms of cutaneous diseases, and have found it to act with more certainly in these affections than any other preparation or single drug that I have used.[21]

Medorrhinum

Here is a key constitutional remedy for the "sycotic" terrain denoted by Hahnemann. These individuals have a problem with time. They are constantly projecting into the future. "What comes next?" This question, which is constantly on their lips, ruins the present for them.
In the family history there are cases of cancer and chronic rheumatism. Medorrhinum infants sleep flat on their stomach, rear in the air. They often have a red rash (erythema) on the buttocks. The children are sensitive to humidity. Their legs are constantly in motion while they are seated.
In the eyes, we find chronic conjunctivitis, with the lids stuck together in the mornings, and astigmatism.
Amelioration at the seaside is a good symptom of this remedy. On the skin, we find a large number of small molluscum pendulum around the neck. "Time is money."

Medorrhinum tries to control time. These individuals are constantly projecting their minds into the future, making them clairvoyant, which makes this a remedy for mediums who predict the future. On the other hand, lack of control, or anarchy, leads to skin tumors and cancer.[19]

Natrum muraticum

Great emaciation; loosing flesh while living well; throat and neck of child emaciate rapidly during summer complaint. Great liability to take cold. Irritability: child cross when spoken to; crying from slightest cause; gets into a passion about trifles, especially when consoled with. Children slow in learning to walk.[3] Child will be slow in learning to speak. Small and underweight child.[12] Warts on palms of hands.[7]

International Research Journal
IJNRD
Research Through Innovation

Silicea

Umbilicated eruptions with offensive pus. Itching only in daytime and evening.[1]

Extremely chilly patient; profuse, offensive discharges; glandular affinity; large head and distended abdomen, weak ankles; [1,51] open fontanelles and sutures;[1] slow in learning to walk; constipation, stool being partly expelled recedes back again; all symptoms worse by cold except stomach complaints; children are obstinate, head strong, cry when spoken kindly to, nervous, apprehensive, oversensitive, irritable and fearful.

- Tuberous spots on skin of light red color.
- Eruptions heal with difficulty and suppurate easily.[51]

Sulfanilamidum

Indicated in molluscum granulosum.[47]

Sulphur

Molluscum in a child; body and limbs covered with soft, round, smooth, apparently painless tumours with broad base. At first of the colour of the skin, then assuming a bluish, and finally a purple or pinkish hue; found on puncture to contain a semi-fluid, sebaceous matter. These tumours vary in size from that of a large bean to a filbert, and were found in all stages of development at the same time, about eighty in number. After Sulphur, no new tumours formed, and the old shrivelled up, without discharging.

- Dr. C. Wesselhoeft.[23,54]

Teucrium marum verum

Indicated remedy in molluscum contagiosum.

Thuja occidentalis

It is a remedy for molluscum.[4] Chilly patient; dark, fleshy children with greasy face; dark hair and unhealthy Skin, looks dirty with brownish spots; perspiration on uncovered parts, smells sweetish and strong; complaints worse damp, humid weather; lazy.

- Eruptions only on covered parts
- Umbilical form of eruptions.[51]

In elderly children, we obtain history of nightmares, dreams of falling and someone chasing and startling in sleep. Here too *thuja* works very well. The remedy works from within outwards. The eruptions become big and they burst open and then subside.[55]

Tuberculinum

It has a good role in establishing cure if given as intercurrent.[1]

CONVENTIONAL TREATMENT

Surgical removal of molluscum contagiosum by curettage has been used for many years. Children will usually need prior application of topical anaesthetic cream with strict observance of the maximum safe dose. Damage to the lesions by squeezing the contents or insertion of a pointed cocktail stick may stimulate inflammation and clearance.

Cryotherapy is effective and commonly used in older children and adults, but needs to be repeated at 3–4 weekly intervals. The carbon dioxide or pulsed dye lasers have produced useful effects but like curettage, can cause scars. Photodynamic therapy has also been used with effect.

Many topical agents can be used to produce mild to moderate inflammation and hence potentially stimulate the development of an immune response against the virus. Cantharidin, trichloroacetic acid and diluted liquefied phenol are strong irritants which can both cause pain, blistering and scarring but with careful application and appropriate dilution can increase lesion clearance. Topical salicylic acid preparations, tretinoin, adapalene, nitric oxide cream and potassium hydroxide solution all lead to an irritant reaction but if the strength of preparation and the frequency of application are adjusted, individuals can tolerate repeated treatments until resolution occurs.[9]

However, a Cochrane Database analysis of treatments for molluscum contagiosum, which identified only five therapeutic studies of high quality, found that no single intervention is convincingly effective for the treatment of molluscum contagiosum.[57]

Few of the commonly used conventional therapies are as follows:

Freezing/Cryotherapy

The lesions are frozen with liquid nitrogen or dry ice at an interval of 2-3 weeks until the lesions are cleared. Though this method is quite effective it sometimes causes hypopigmentation or hyperpigmentation and scarring.

Evisceration

The core of the lesion is excavated with help of sharp instruments like scalpel, sharp tooth pick, edge of a glass slide. Patients themselves can carry out this procedure if carefully taught. This method is though not applicable to children as the procedure can be really painful.

Scraping/ Curettage

The lesions are scraped off with the help of sharp instruments. Use of topical anesthetic agents is advised to combat the pain. The method has an advantage of providing a reliable tissue sample for the confirmation of diagnosis of Molluscum Contagious.

Electrosurgery/ Laser Cautery

The lesions are burnt either with electric cautery or Laser beam is used to burn the spots.

Squeezing

A local anesthetic cream is applied to the area and left on under a plastic film for one hour before the procedure. Then the lesion is squeezed out with the help of forceps or sharp sticks.

Tape stripping

Sterilized adhesive tapes are repeatedly applied and removed over the lesions and removed so that the superficial epidermis is effectively removed. However, repeated use of the same strip is likely to spread the virus to adjacent, uninvolved skin.

Chemical applications

Which are prepared with metal silver as the base can prevent the bacterial infection and hence enhance the process of recovery.[40]

INSECT GROUP OF MEDICINES AND ITS UTILITY IN COMPLAIN OF URINARY SYSTEM

[1]Dr. Vineeta Neeraj Kumar, [2]Dr. Jaya Srivastava, [3]Dr. Syeda Massarrat Sultana Shehla

[1]Assitant Professor, [2]Assitant Professor, [3]Professor
[1]Surgery,
[1]Aarihant Homoeopathic Medical College & Research Institute, Gandhinagar, India

Keywords- Group symptoms, urinary system, urogenital disorders, Homoeopathy, ureter stones, Insect group of remedies

Abstract: In the urinary system the organ which is involved are kidneys, ureter, Bladder and urethra. The function of kidney is excretion of waste products Like urea, uric acid, creatinine etc. Maintenance of water balance,
Maintenance of electrolytes balance, maintenance of acid-base balance, Hemopoietic function, regulation of blood pressure and regulation of blood Calcium level.

Urinary tract infection is a common problem despite age and sex Worldwide. Some of the most common bacterial infections, affecting 150Million people each year worldwide. The estimated economic burden is more than 6billion U.S. dollars, about 40% of women and 12% men experience at least one symptomatic urinary tract infection during their lifetime, and as many as 40% of affected women show recurrent urinary tract infection. In pregnant women in India is reported to range from 3% to24%. Now a day, some common diseases are day by day increasing like urinary tract infection, urine incontinence, renal stone, ureteric stone, bladder stone, hematuria, urethral stricture, urethritis, lower urinary tract infection and cystitis, retention of urine etc. If there is any disturbance in function of kidney, symptoms like burning micturition, pedal edema, strong persistent urge to urinate, cloudy urination, painful urination, usually pain in right/left lumbar region, honeymoon cystitis etc. may develop. All these symptoms are present due to some causes like bacterial cause. Viral cause, low water intake, sexual intercourse etc. In modern science these diseases are treated with antibiotics, analgesics and hydration therapy, but many antibiotics are resistant in many people and produced side effects. Calculi are also treated with surgeries. But the chances of recurrence are more and person suffers more with these diseases. In contrast to other therapy homoeopathy is cost-effective and without any side-effects. All urinary tract infections and kidney diseases can be well managed with homoeopathy. Homoeopathy believes in individualization. Medicine selection is based on totality of symptoms. Our materia medica is full of important remedies for urinary system disorders. As usual to grasp all the symptoms of all the medicines is always a difficult task. So, there are various approaches to study materia medica. One among these is group symptoms study. There are many common features of a group of medicine belonging to same sources. In homoeopathy we have animal kingdom, plant kingdom, nosodes, saracodes, imponderabilia sources from which medicines are prepared. If one studies common symptoms of each group one can found something similar. Insect group of medicine belongs to animal kingdom. They also share common features. Majority of insect group medicines have action on urinary system e.g., Medicine like Apis mellifica, Cantharis vesicatoria, Coccus cacti, Formica rufa, Vespa crabro etc. belongs to this group. Until now little work has been done on the insect group. So, I did this work to evaluate efficacy of insect group in urinary system disorders.

AIMS AND OBJECTIVES

To study common group symptoms of insect group of medicines

REVIEW OF LITERATURE

Excretion is the process by which the unwanted substances and metabolic wastes are eliminated from the body. A large amount of waste materials and carbon dioxide are produced in the tissues during metabolic process. In
addition, residue of undigested food, heavy metals, drugs, toxic substances and pathogenic organisms like bacteria are also present in the body. All these substances must be removed to keep the body in healthy condition. Various systems/organs in the body are involved in performing the excretory function, viz. Digestive system, Lungs, Skin, Liver etc. Although various organs are involved in removal of wastes from the body, their excretory capacity is limited. But renal system or urinary system has maximum excretory capacity and so it plays a major role in homeostasis. The urinary system is a passive biological system that removes excess,

unnecessary materials from the body fluids of an organism, so as to help maintain internal chemical homeostasis and prevent damage to the body. In the urinary system these organs are present. Kidney, ureter, urinary bladder, urethra. (3,4)

Functions of urinary system

KIDNEYS

- Excretion of metabolic waste products and foreign chemicals
- Regulation of water and electrolyte balances
- Regulation of body fluid osmolality and electrolyte concentrations
- Regulation of arterial pressure
- Regulation of acid-base balance
- Regulation of Erythrocyte Production
- Regulation of 1,25-Dihydroxyvitamin D3 Production
- Secretion, metabolism, and excretion of hormones
- Gluconeogenesis (3,4)

URETER

Its duct that transmits urine from the kidney to the bladder. There normally is one ureter for each kidney. Each ureter is a narrow tube that is about 12 inches (30 cm) long. A ureter has thick contractile walls, and its diameter varies considerably at different points along its length. The tube emerges from each kidney, descends behind the abdominal cavity, and opens into the bladder. At its termination the ureter passes through the bladder wall in such a way that, as the bladder fills with urine, this terminal part of the ureter tends to close.

URINARY BLADDER

Urine, excreted by the kidneys, collects in the bladder before disposal by urination (micturition). The urinary bladder usually holds 300350 ml of urine. As urine accumulates, the rugae flatten and the wall of the bladder thins as it stretches, allowing the bladder to store larger amounts of urine without a significant rise in internal pressure. Urination is controlled by the pontine micturition center in the brainstem. (3,4,7)

Common symptoms of urinary disorders

Symptoms of urinary disorders vary from person to person and based on the cause of the disorders. Common urinary symptoms include:

- Abdominal cramping
- Abdominal, pelvic or back pain that can be severe
- Bloody or pink-colored urine (hematuria)
- Cloudy urine
- Fever and chills
- Foul-smelling urine
- Frequent urination
- General ill feeling
- Leaking of urine
- Pain during sexual intercourse
- Pain or burning with urination (dysuria) (3,4,8)

URYNARY SYSTEM DISEASES AND HOMOEOPATHY

In renal diseases, like any other case, individualization process involves ascertaining the totality of signs &symptoms, a complete account of all the sufferings as described by the patient himself, his attendants and findings of special investigations. Here one can adopt 2 different approaches in accordance with the fact that whether, the case at the time of consultation demands an acute medicine or chronic constitutional treatment. This will solely depend on the severity & violence of the chief complaints causing distress to the patient.

Acute Renal manifestations

In cases with acute distress, for e.g. In Renal, vesical or ureteric colic, strangury etc, first of all it is necessary to relieve the patient of his sufferings. Moreover, the physician should also recognize the need of auxiliary measures, hospitalization, surgical or mechanical intervention etc. In a case of acute retention with intense supra-pubic discomfort and threatening shock, it is of prime importance to mechanically evacuate the bladder by catheterization. (10)

At this point, it would be suitable to quote Dr. Stuart Close—

—Circumstances sometimes arise when the strongest man & ablest prescriber, by reason of the great moral pressure brought to bear upon him, by the peculiarities of his patient, of the environment, or from lack of time, will be compelled to tide over a period of unendurable suffering by use of analgesics, or some other measure to meet extra-ordinary emergencies. He does this as a charitable concession to the weakness of human nature…., But time & circumstances are at least sometimes beyond his control. It is possible to violate the spirit by adhering too closely to the letter of law. Victory is sometimes gained be appearing to yield,

which is quite in accord with the principle of Similia, a sort of moral homeopathy‖. In acute emergencies, homeopathic medicines can act as quickly and sometimes even more efficiently as compared to other therapeutic systems, provided the correct medicine is administered in correct potency

Dr. H. Roberts, in his ‗Principles & Art of Cure by Homeopathy ', encourages us as follows—―The homeopathic physician recognizes an important principle in these serious states; the more acute the case, the more the infection strikes at the life of the patient, the more clearly indicative are the symptoms. The similar medicine works regardless of the name of disease towards a true & complete cure, without sequalae or constitutional involvement. (10)

Chronic Prescribing in Patients with Renal diseases

First of all, we should have a record of all the presenting complaints in their completeness, with special attention to duration, mode of onset, modalities & concomitant features of each individual symptom. Then the details concerning the Past Medical History and Family History are to be collected. The history of the treatment been taken by the patient till date, is also to be noted. Now the most significant turn comes where the interrogation is to be made as regards Physical generals & Mental generals, which though apparently seem to be unrelated to the case, yet they serve as the backbone of homeopathic prescribing!!

In case of mental symptoms, one should investigate the life situation of the patient with type of response. Emotional characteristics are very difficult to be elicited by direct questioning; hence the physician has to be tactful in approach & keen in perception to record them. Anger, loves, hates, anxieties, fears, phobias, irritability, relationship to loved ones, personal preferences concerning company or solitude, apathy, general mood, self-confidence etc., furnish as valuable features. Dreams too deserve attention. The mental faculties of the patient can be investigated by recording peculiarities related to intellect, memory, delusions, concentration powers, and comprehension ability. (10)

GROUP STUDY OF INSECT GROUP OF MEDICINES: -

Insects are invertebrate animals – without back bone – and are included in arthropods. Arthropoda is the largest, most dominant group and includes about 80% of known animal species. They are capable of flying. Entomology refers to study of insects. Insects are grouped in the kingdom under phylum arthropod & the class insects.

o Phylum: Arthropoda

o Class: Insect

Man had started the use of insects and insect products since time immemorial even at the cost of animal 's life. Insects have been under use inhuman civilization since prehistoric period as mentioned in our religious literatures like Vedas, puranas, the Ramayana, Mahabharata and charka Samhita. Some foreign travelers like Fahiyan and when son had also discussed the use of insects and insect 's product as medicine. As far as Homeopathy is concerned insects have a major role in the preparation of medicines.

CLASSIFICATION

Insect group is classified as follows: -

1. Hymenoptera
2. Lepidoptera
3. Coleoptera
4. Orthoptera
5. Hemiptera
6.Diptera
7. Siphonaptera

1. Hymenoptera (9)

- Apis Mellifica – Honey Bee
- Apium virus – Poison of Bee
- Formica rufa – Crushed Live Ants
- Vespa crabro – Common Wasp

2. Orthoptera

- Blatta americana – Great American cockroach
- Blatta orientalis – Indian cockroach

3. Lepidoptera

- Bombyx chrysorrhoea – brown tailed moth
- Bombyx processionea– procession moth

4. Coleoptera

- Canthris vesicatoria – Spanish fly
- Coccinella septum punctata – Indian lady bug
- Doryphora decemlineata – Colorado potato bug
- Triatema – kissing bug

5. Hemiptera

- Chenopodium glauci aphis – plant lice from Chenopodium.
- Cimex acanthia – Indian bed bug
- Coccus cacti – Coccineal insect (insect affecting Cactus).
- Pediculus capitis – head louse
- Pedicullus cooties

6. Dipteria

- Culex musca – culex mosquito

7. Siphonoptera

- Pulex irritans – common flea

Hymenoptera venum Effects: (9)

Functions as hastens that form immunogenic conjugates host proteins. Life threatening anaphylactic response of a sensitized human appears within minutes after administration of specific antigen and is manifested by respiratory distress often followed by vascular collapse or by shock without antecedent respiration difficulty.

- Cutaneous manifestations: Pruritus' and urticaria with or without angioedema. Localized, non-pitting, angioedema may occur which may be asymptomatic or cause a burning or stinging sensation.
- Gastro intestinal manifestations: Nausea, vomiting crampy abdominal pain and diarrhea.
- Respiratory system: Manifestations laryngeal edema, experienced as a lump in the throat, hoarseness or strider. Bronchial obstruction is associated with a feeling of tightness in the chest of audible wheezing. Angioedema of the epiglottis and larynx and to some extend in the hypo pharynx and trachea, causes mechanical obstruction and death.
- Cardiovascular system: Manifestable visceral congestion with a loss of intravascular blood volume leads to vascular collapse and death.

Important remedies

- Aphis chenopodii glauci
- Apis mellifica (Honey bee)
- Blatta Americana (Cockroach)
- Blatta orientalis (Indian cockroach)
- Cantharis vesicatoria (Spanish fly)
- Cimex lectularius (Bedbug)
- Coccinella (Lady bug) (1,2,5,6,9)
- Coccus cacti (Cocchineal)
- Culex musca (Culex mosquito)
- Doryphora decemlineata (Colorado potato bug)
- Formica rufa (Crushed live ants)
- Oniscus asellus (Wood louse)
- Pecten jacobaeus (Head louse)
- Pediculus capitis
- Pulex irritants (Common flea)
- Scolopendra morsitans
- Triatema (Red acraus of the fly)
- Trombidium muscae domesticate
- Vespa crabro (Live wasp) (1,2,5,6,9)

Insect themes:

Insect remedies are potentially huge in number and so studying the themes of many insect families is a challenging but fascinating process, especially as there are so many different types of insects with their own unique behavior.

The key characteristics of many of the insect remedies are as follows:

- Quick, fast, sudden
- Busy, industrious, active – effective or fruitless.
- Fastidious, order, linearity, communication.
- Irritability, anger, rage, violence. Attacking and being attacked.
- Sexuality, attractiveness or repulsion, sexual aggression, perversion, impotence, impersonal sexuality. (9)
- Appearance, needing to be attractive; beauty, clothing, and the opposite of feeling unattractive.
- Masculinity in women.
- Relationships, struggle with them. Superficial. Needing to be in groups but no strong sense of identity.
- Self-centered, demanding, egotistical. Needing attention. Contemptuous.
- Low self-esteem. Feeling dirty, shame about the body, self-disgust, self-hatred
- Appetite voracious or ability to do without food for long periods.
- Aversion to water. Hydrophobic.
- Swellings, puffiness, inflammation.
- Burning, stinging, biting pains.
- Affinity for urinary organs, joints. (9)

General features of insecta

Side affinity

Right

1. Apis Mellifica
2. Blatta Americana
3. Cantharis Vesicator
4. Coccinella Septumpunctata
5. Formica Rufa (1,2,5,6,9)

Left

1. Cimex Acanthia
2. Pulex Irritans
3. Vespa Crabro

Burning pain

- Apis mellifica: Burning, stinging, lancinating pain with excessive swelling, > Cold application, <By heat, slightest touch or pressure
- Formica Rufa: burning pain renewed from cold washing.

- Vespa crabro: - Burning > bathing with vinegar. Cold water applied first > then <.
- Bomyx Processionea: - Burning heat of skin
- Doryphora decemlineata: - Burning in mouth, throat, stomach, rectum and urinary passages. <Warm room > open air
- Cantheris Vesicator:- Raw, sore, burning & a sharp lancinating pain <slightest tough, >Warm application

Sensitiveness

- Apis Mellifica: - Great sensitiveness to touch.
- Cantharis vesicator :- Over sensitiveness of all parts. The slightest touch or approach aggravates the mental symptoms.
- Coccus cacti: -General sensitiveness to touch and pressure. Fauces are very sensitive. Brushing teeth causes cough.
- Doryphora Decemlineata: < touch and pressure

Thirst:

- Apis Mellifica: Thirst less except during chill stage of intermitted fever.
- Cantharis Vesicator: Burning thirst with aversion to drinking (picture of hydrophobia). In fever, thirst only after the shivering.
- Coccinella septum punctata: Symptoms of hydrophobia.
- Cocus cacti: Mouth and tongue dry, with much thirst. After dinner much thirst and when he drinks water, then chilliness.
- Cimex acanthia: Thirst during apyrexia, but little during chill stage, still less during heat stage and none during sweating.
- Pulex Irritans:- Thirsty , especially during headache(9) ***Swelling, dropsy, ascites:***
- Apis mellifica: - Oedema of skin and mucous membrane. Swelling or Puffiness up of variance parts. Pale waxy oedematous swelling with a red rosy hue. Ascites and anasarca. Dropsy of Apis is characterized by thirstlessness, transparency of skin and scant urine. Bag like swelling under the eyes. Dropsy of right ovary and right testicle.
- Blatta Americana: - Ascites, various forms of dropsy, yellow complexion. (Jaundice)
- Doryphora decemlineata:- Elastic swelling of whole body which will not pit on pressure. (Applicability in myxoedema). Swelling of feet
with burning.
- Vespa Crabro: – Face swollen and puffy, skin transparent and blanched. Baggy swelling of conjunctiva. Face, mouth and throat oedematous.
- Cantharis Vesicator: - burning redness and swelling of face, swelling and inflammation of lips. Dropsical swelling of hand, feet and abdomen.

Female complaints – overian affections.

- Apis mel:- Inflammation, induration, swelling and dropsy of the ovaries especially the right better by lying on right side. Sharp, cutting, stinging pain in the right ovary. Worse during menstruation. Ovarian tumors, with stinging pain like bees sting. Increased sexual desires. Tendency to abort at or before 3rd month. Amenorrhea of puberty. With congestion of head thirstlessness and intolerance of heat.
- Cantharis: - Inflammation of ovaries, burning pain, extremely sensitive. (9)
- Cimex acantha: - Shooting pain from vagina towards left ovary.
- Vespa crabro: – Left ovary markedly affected with frequent burning micturation. Menstruation preceded by a period of depression and constipation.
- Cocus cacti: - Indicated in menorrhagia and metrorrhagia. Dark clots with dysuria.

Skin manifestations – urticaria.

- Apis mellifica: -Urticaria like bee stings or stings from other insects with intolerable itching at night. Swellings after bites are sore and sensitive. Erysipelas with sensitiveness and swelling, rosy hue. Carbuncle with burning stinging pain. Eruptions like nettle rash all over the body.
- Formica rufa: - Nettle rash, red itching and burning. Profuse sweat without relief.
- Vespa crabro: - Erythema with intense itching and burning > bathing with vinegar. Wheals, swelling and macules with stinging burning and soreness. Cold water application first >, then <.
- Bomyx Processionoea :- Indicated in Urticaria- intense irritation, hard large areola formed. Tubercle with a red areola. Sensation as of a foreign body were under the skin. Itching <evening not relieved by anything. Burning heat of skin.
- Cantharis Vesicator:- Vesicular eruptions with burning and itching.Vesicules all one's body Which are sore and suppurating. Erythema from exposure to sunrays. Burns, scalds with rawness and smarting relieved by cold application, followed by undue inflammation. (9)
- Pediculus: - Psoric manifestation in children, Milliary eruption on inside of forearms and thigh. Horropilation all over.

Hemorrhage:

- Apis mellifica: - Dark hemorrhage from rectum, urine, uterus, respiratory organs.
- Cocuscacti :- Hemorrhage in large black clots especially from kidneysand uterus. menses too, too profuse lasts too long.
- Cantharis: - hemorrhage from nose, mouth, intestine, genital andurinary organs. Emission of blood in drops from urinary organsMenses early, copious, black blood.

Fever

- Apis mellifica: - Intermittent fever where chill occurs at 3pm with thirst. < from warmth followed by burning heat of whole body with absence of thirst and comes sweat with complete absence of thirst. Indicated in exanthematic fevers and fevers complicated with suppression of eruptions.
- Cantharis: - Cold & shivering. Thirst only after shivering cold. Perspiration especially on hands, feet & genitals. sweat smells of urine. Pulse full, hard and rapid.

Cimex acnthia:- intermittent fevers with weariness and inclination to stretch. Chilliness of whole body, pain in all joints as if tendons were too short, esp. knee joint. Chill < lying down. Thirst during apyrexia, but little during chill stage, still less during heat stage and none during sweat stage. (9)

Rheumatism

Formica rubra: - Rheumatic inflammation of eyes and spinal cord. Gout and articular rheumatism. Right side is more affected. Rheumatism comes with suddenness and restlessness. Patient desires motion, but pain worse from motion.

Apis mellifica: - Acute inflammatory rheumatism with burning, stinging and swelling. Pain < on any motion.

INSECT GROUP OF MEDICINES AND IT 'S UTILITY IN COMPLAINTS OF URINARY SYSTEM: -

Apis meilifica: -

o Burning and soreness when urinating.
o Can scarcely retain urine.
o When passed scalds severely.
o Incontinence of urine when coughing and sneezing.
o Frequent, painful, scanty, bloody urine, stinging pain and strangury.

Blatta Americana: -

o Pain in urethra while micturating.

Cantharis vesicatoria: -

o Kidney region very sensitive.
o Urine; Burning, scalding; with cutting intolerable urging and fearful tenesmus or dribbling.
o Gripping in bladder, renal colic amel; somewhat by pressure on glans penis, bloody urine.
o Constant urging to urinate, passing but a few drops at a time, which is mixed with blood like molten lead.
o Intolerable urging before, during and after urination. (1,2,5,6,9)
o Burning, cutting pain in urethra during micturation.

Coccus cacti: -

o Lancinating, violent pain from kidneys to bladder; with dysuria.
o Nephritic colic, constant urging to urinate, amel; after passing stools clots from the vagina in females.
o Staking pain along ureters.
o Burning pain in urethra while urinating.
o Frequent urination.
o Black red sediment, urinary calculi, urates and uric acid, haematuria, dysuria, lassinating pain from kidney to bladder.

Chenopodii glauci Aphis: -

o Voluptuous feeling in the glands.
o Burning in urethra.
o Frequent copious frothy micturition.

Doryphora decemlineata: -

o Burning in urinary passages, strangury, urethritis itching and burning.
o Inflammation of glans penis.
o Urethritis due to local irritation.

Formica rufa: -

o Urine bloody.
o Albuminous with urates.
o Paralysis of bladder.
o Double the quantity of urine, even at night.
o Urine like saffron bright yellow.

Oniscus asellus: -

o Cutting, burning in urethra.
o Tenesmus of bladder and rectum, with absence of stool and urine.

Pulex irritants: -

o Urine scanty with frequent urging with pressure on bladder and burning in urethra.
o Flow stops suddenly followed by pain, can 't retain urine.
o Irritable bladder before menses.

Vespa crabro: -

o Burning micturation in females.
o Dysurea with backache. (1,2,5,6,9)

ABSTRACT

OBJECTIVE- To study the knowledge of breast cancer, early detection methods and whom to consult after detecting abnormality among female tertiary health workers.
METHOD- This is a descriptive cross-sectional study of 70 female health workers age group more than 20 years carried out at various hospitals after taking consent.
RESULT- Being majority of young married doctor respondents, below the age of 40 years (81.4%) study was conducted, almost all the respondents are aware of breast cancer, 69 (98.5%). Majority of them got information from media (77.1%), followed by seminars (64.2%) and books (62.8%). Only 15.7% of respondents had a positive family history of breast cancer. Most participants were aware of BSE and thinks its useful tool (74.3%) but doesn't know about proper timing and method for BSE. They have been taught BSE (58.5%) out of which majority were taught by teachers (51.5%). 41.4% and 60% of respondents knew that BSE should be done monthly and should start after age of 20 respectively. One

respondent has discovered an abnormality. Respondents are relatively less aware about BSE 28 (40%). 45 (64.3%) and 16 (22.9%) think that BSE should be done by a doctor and trained nurse respectively. The level of awareness of sonomammography was high among respondents- 43 (57.1%), but only 8 (11.43%) had undergone sonomammography, because of 'not of proper age' 27 (38.57%).
CONCLUSION- Practice and attitude of breast cancer screening should be promoted among health workers and the general population.

KEY WORDS-
Breast self-examination (BSE)
Clinical breast examination (CBE)
Sonomammography

INTRODUCTION

A wide variety of diseases affect the breast ranging from benign to malignant. Benign breast diseases are more common than the malignant ones. [(1)] carcinoma however is the most typical malignancy in several countries. [(2)(3)(4)] Patients with breast lesions could complain of breast pain, breast lump, nipple discharge, nipple retraction, skin disease or eczema of the areola (in Paget's disease). Breast lump that is one of the most common types of breast lesion and is detected by: breast self-examination (BSE), clinical breast examination (CBE), and sonomammography. Early detection and prompt treatment have shown good results and are responsible for long survival in patients with carcinoma. [(5)(6)] Sonomammography, CBE are used for screening for early detection of carcinoma. Cancer screening tests play a polar role in reducing breast cancer-related mortalities. The American Cancer Society (ACS) recommends CBE and sonomammography for the early detection of carcinoma.[(7)] According to ACS recommendations, females should be aware of normal consistency of their breasts and should report to health care workers if there is any change in the consistency.[(8)(9)] Women should know the perks of BSE from their early 20s.The ACS has discarded BSE as an accurate marker as it doesn't increase the survival rate.[(10)] However, BSE appears to be a vital substitute accessible in rural areas wherever access to CBE and sonomammography is tough and would possibly still discover carcinoma early enough for treatment which might be offered to prolong women's lives and cut back suffering. For average-risk women in their 20s and 30s, they are suggested to go for CBE as a part of a periodic health examination, in the 40s CBE is used as an adjunct to radiological screening (mammography). The underlying premise for carcinoma screening is that it permits for the detection of breast cancers before they become palpable. It is proved according to different trials that screening-detected breast cancers are related to reduced morbidity and mortality. This study aims at assessing the knowledge, awareness and opinion of female staff working in a hospital.

MATERIALS AND METHODS

Study design
This is a descriptive cross-sectional study of female medical staff carried out at various hospitals.
Study population
The study population consists of female health workers of age group of more than 20 years.
Sampling procedures
Female health workers were included after taking consent. Convenience sampling was done to obtain the sample size.
Instruments and Data collection

A structured, pre-tested questionnaire was the tool of data collection, which contains information regarding the sociodemographic characteristics, knowledge of breast cancer, knowledge and practice of BSE, CBE and sonomammography.

OBSERVATIONS AND RESULTS

This study was conducted on 70 participants who were asked about 40 questions each from which 35 questions were found adequate for analysis. Studies have been done on knowledge, attitude, and practice of breast cancer screening in health workers of a tertiary health care centre.

Table 1: Socio-demographic data of respondents

Variables	
Age (years) (n = 70)	**n**
20-29	35
30-39	22
40-49	1
50-59	10
60-69	2
Marital status (n = 70)	
Single/never married	31
Married	39
Widowed	0
Highest educational level (n=70)	
Primary school completed	0
JSS completed	0
SSS completed	1
Tertiary school completed	0
No formal education	2
Others	67
Occupation (n = 160)	
Doctor	17
Nurse	9
Pharmacist	0
Laboratory staff	2
Office staff	9
Ward maid	1

Cleaner	9

A majority of the respondents in this study belong to the younger population. Majority of respondents are below the age of 40 years with 81.4%. Majority of respondents are Doctors making up the majority; 24.4% and nurses, office staff and cleaners making 12.8% each. Majority of respondents are married, 55.7%.

Table 2: Respondents' knowledge of breast cancer

Variables	
Ever heard of breast cancer (n=70)	**n**
Yes	69
No	1
Sources of information about breast cancer* (n=70)	
Books	44
Media	54
Hospital	41
Lecture	35
Conference/seminar	45
Friends	41
Have any of your relatives been diagnosed with breast cancer? (n=70)	
Yes	11
No	59
If yes, which relative? (n=52)	
Mother	0
Aunt	5
Sister	3
Cousin	3
Other relative	41

*Multiple response

Almost all the respondents are aware of breast cancer, 69 (98.5%). Majority of respondents got information about it from media (77.1%), followed by seminars (64.2%) and books (62.8%). Only 15.7% of respondents had a positive family history of breast cancer.

Table 3: Respondents' knowledge of breast self-examination

Variables	
Ever heard of BSE (n = 70)	**n**
Yes	52

No	18
Is BSE a useful tool for early detection of breast cancer? (n = 70)	
Yes	51
No	19
Have you been taught how to do BSE? (n=70)	
Yes	41
No	29
If yes, who taught you? * (n = 51)	
Parents	26
Teacher	36
Doctor	32
Nurse	16
Friend	6
Others	19
At what age should BSE be started? (n = 70)	
From puberty	10
From 20 years	42
No idea	18
How often should BSE be done? (n = 70)	
Weekly	4
Monthly	29
Yearly	9
No idea	28
What is the best time to do BSE? (n = 70)	
During menstrual flow	8
A week after period	29
During pregnancy	10
During feeding	7
No idea	34
BSE should be done by (n = 52)	
Doctor	32
Trained nurse	16

The individual	14
BSE is done by* (n=25)	
Inspecting the breast in the mirror	5
Feeling the breast with the hand	20
Feeling the armpit with the hand	0
Doing ultrasound of the breast	0
Sonomammography	0

*Multiple responses.

Most participants were aware of BSE and thinks its useful tool for early detection of breast cancer (74.3%). They have been taught BSE (58.5%), out of which majority were taught by teachers (51.5%) followed by doctors (45.7%) and parents (37.1%). Only 41.4% and 60% of respondents knew that BSE should be done monthly and should start after age of 20 respectively. Majority doesn't know about proper timing and method for BSE.

Table 4: Respondents' practice of breast self-examination

Variables	**n**
If you discover any abnormality during BSE, what will you do? * (n = 65)	
Do some lab tests	0
Pray over it	0
See a doctor	60
Other	5
Benefits of BSE* (n = 65)	
Familiar with breast texture	12
Early detection of breast cancer	50
Detection of abnormal changes	20
A good breast exercise	4
Do you practice BSE? (n = 70)	
Yes	41
No	29
If yes, how often? (n = 43)	
Weekly	9
Monthly	3
Occasionally	13
Rarely	18

If you have been practicing BSE, have you ever discovered any abnormality in your breast? (n = 46)	
Yes	1
No	45
If yes, what did you do? (n = 44)	
Prayed over it	0
Saw a doctor	30
Did nothing	1
Other	13
Do you think BSE is a good practice? (n = 17)	
Yes	52
No	8

*Multiple responses. BSE-Breast self-examination

Reasonable numbers of respondents claim that they do BSE 41 out of 70 – 58.5%. 9 (12.8%) stated that they did it weekly. While 13 (18.6%) said occasionally and 18 (25.7%) stated that they do BSE rarely. Out of them only 1 has discovered an abnormality. Out of 70 respondents 52 (74.3%) think that BSE is good practise and they 60 (85%) will see a doctor if they found any abnormality.

BSE=Breast self-examination, CBE=Clinical breast examination

*Multiple responses

Awareness of CBE is also slightly low among the respondents compared to developed countries- 28 (40%). From them 29 (41.4%) knew that CBE could be used for detection of breast cancer. 45 (64.3%) and 16 (22.9%) out of 70 think that BSE should be done by a doctor and trained nurse respectively. Most of the respondents do not know how CBE is done as 9 (12.8%) thought it is done using ultrasound, 36 (51.4%) thought CBE is done using sonomammography machine and another 24 (34.3%) have no idea. Furthermore, only 17 (24.3%) of the cases recognized that CBE should be done yearly while the rest have other incorrect responses.

Table 6: Respondents' knowledge and use of sonomammography

Variables	**n**
Ever heard of sonomammography? (n = 70)	
Yes	43
No	27
Is sonomammography a useful tool for early detection of breast cancer? (n = 70)	
Yes	43

Not old enough	27
Financial constraint	6
Sonomammography not available	4
Other	25

*Multiple responses

The level of awareness of sonomammography was generally high among respondents- 43 (57.1%) and same knew that sonomammography could be used as a tool for early detection of breast cancer. But only 8 (11.43%) had undergone sonomammography at least once. Others who haven't undergone sonomammography are not of proper age 27 (38.57%), 6 respondents have financial issues, while for 25 (35.7%) respondents there are some other reasons. In addition, 20 (28.57%) of the respondents noted that sonomammography should be commenced from the age of 40 years and above while the rest responded inappropriately. Similarly, only 8 (11.43%) of the respondents knew that sonomammography should be done yearly.

DISCUSSION

1**.** A majority of the respondents in this study belong to the younger population. Majority of respondents are below the age of 40 years with 81.4%. Majority of respondents are Doctors making up the majority; 24.4% and nurses, office staff and cleaners making 12.8% each. Majority of respondents are married, 55.7%.

2. Almost all the respondents are aware of breast cancer, 69 (98.5%). Majority of respondents got information about it from media (77.1%), followed by seminars (64.2%) and books (62.8%). Only 15.7% of respondents had a positive family history of breast cancer.

3. Most participants were aware of BSE and thinks its useful tool for early detection of breast cancer (74.3%). They have been taught BSE (58.5%), out of which majority were taught by teachers (51.5%) followed by doctors (45.7%) and parents (37.1%). Only 41.4% and 60% of

respondents knew that BSE should be done monthly and should start after age of 20 respectively. Majority doesn't know about proper timing and method for BSE.
4. Most respondents say that they do BSE 41 out of 70 – 58.5% and 9 (12.8%) stated that they did it weekly. Out of all only 1 has discovered an abnormality, while 52 (74.3%) thinks that BSE is good practise and they 60 (85%) will see a doctor if they found any abnormality.
5. Respondents are relatively less aware about CBE than developed countries- 28 (40%). 45 (64.3%) and 16 (22.9%) out of 70 think that BSE should be done by a doctor and trained nurse respectively. Most of the respondents do not know how to do CBE. Only 17 (24.3%) of the cases recognized that CBE should be done yearly while the rest have other incorrect responses.
6. The level of awareness of sonomammography was generally high among respondents- 43 (57.1%) and same knew that sonomammography could be used as a tool for early detection of breast cancer. But only 8 (11.43%) had undergone sonomammography at least once. The major reason behind not undergoing sonomammography was 'not of proper age' 27 (38.57%). 20 (28.57%) of the respondents noted that sonomammography should be commenced from the age of 40 years and above. Only 8 (11.43%) of the respondents knew that sonomammography should be done yearly.

CONCLUSION

Prevalence of the knowledge about breast cancer and its screening techniques are low in health workers also. Practice and attitude of breast cancer screening should be promoted among health workers and the general population. Sonomammography which is still the gold standard of breast cancer screening must be promoted for knowledge and benefit of the health workers and then the general population.

Approach Of Homoeopathic Medicine In Acute Abdominal Pain

Dr. Santosh kumar Jha, Professor & HOD, Department of Gynaecology & Obstetrics, Aarihant Homoeopathic medical College & RI, Bhoyan Rathod, Gandhinagar, Gujarat.

Dr. Maheshkumar A. Gite, Professor, Department of Repertory, Aarihant Homoeopathic medical College & RI, Bhoyan Rathod, Gandhinagar, Gujarat.

Dr. Riddhi J Makwana, Assistant Professor, Department of Gynaecology & Obstetrics, Aarihant Homoeopathic medical College & RI, Bhoyan Rathod, Gandhinagar, Gujarat.

What do you mean by the term Acute Abdominal Pain? A Lot of people get confused between a stomach pain which could be due to some gastric issues and the term acute abdominal pain. Acute abdomen refers to a sudden, severe abdominal pain and requires immediate diagnosis and cure. It is such a condition in which quick attention and treatment is needful. Abdominal pain is common and often miner. Abdominal pain is pain that occurs between the chest and pelvic regions.

Abdominal pain can be crampy, achy, dull and sharp or intermittent. Its also called a stomachache. Major organs located in the abdomen includes intestine, kidneys, appendix, spleen, stomach, gall bladder, liver and pancreas. Viral, bacterial or parasites infection that affects the stomach and intestine, may also cause significant abdominal pain. This type of pain can be described as localized, cramp like or colicky.

Localized pain is limited to one area of the abdomen. This type of pain is often caused by problem in a particular region. The most common cause of localized pain is stomach aches. Cramp like pain may be associated with diarrhea, constipation and bloating. In women, it can be associated with menstruation, miscarriage or complication in the female reproductive organ. This pain comes and goes and may completely subsides on its own without treatment.

Colicky pain is a symptom of more severe condition such as kidney stone. This pain across suddenly and make feel like as severe muscle spasms. Older adults and those who have HIV infection or who are taking immune suppressant may have less abdominal pain than younger or healthy adult with a similar disorder, and if the condition is severe, the pain may develop more gradually. Approximately 50% cases are admitted to general surgical unit urgently.

Abdominal pain has a large number of possible causes and so therefore a structured approach is compulsory. The treatment of pain is a collaborative effort. Causes can be divided in to six large categories including inflammatory, mechanical, nephrotic, vascular, congenital and traumatic. Who are in unstable condition have severe abdominal pain with concerning and abnormal vital sign such as fever, low blood pressure, increased heart beat and loss of consciousness.

Homoeopathic medicines are prescribed on the basis of individualization and symptom similarity by using holistic approach. On the basis of cause, sensation and modalities of the complains the appropriate medication is provided.

• Aconitum napellus: Hot, tense, enteritis. Sensitive to touch. Colic, no position relieves. Pains are intolerable, they drive him crazy; restless; at night. Abdominal symptoms are better after warm soup. Burning in the umbilical region.

• Aloe socotrina: Pulsating pain around navel, worse pressure. Cutting, gripping pain under the right ribs or in the right hypochondrium, right lower portion of the abdomen; excruciating before and during stool; all pain ceases after stool, leaving profuse sweating and extreme weakness; copious flatus.

• Belladonna: Distended, hot. Transverse colon protrudes like a pad. Tender, swollen. Pain as if clutched by a hand; worse jar, pressure. Cutting pain across; stitches on the left side of abdomen, when coughing, sneezing or touching it. Extreme sensitiveness to touch.

• Mag phos: Enteralgia, relived by pressure. Flatulent colic, forcing the patient to bend double; relieved by rubbing, warmth, pressure; accompanied with belching of gas, which gives no relief. Bloated abdomen, must loosen clothing, walk about and constantly pass flatus.

• Nux vomica: Flatulent distention with spasmodic colic. Colic from uncovering. Liver engorged, with stitches and soreness. Colic with upward pressure, causing short breath. Strangulated hernia.

• Plumbum metallicum: Excessive colic, radiating to all parts of body. Abdominal wall feels drawn by a string to the spine. Intussusceptions; strangulated hernia. Abdomen retracted, obstructed flatus with intense colic. Colic alternates with delirium and pain in atrophic limbs.

Polygonum punctatum: Griping pain, with great rumbling, nausea and liquid faeces. Flatulent colic.

• Dioscorea villlosa: Feeble digestive powers. Violent twisting colic, in paroxysms, as if intestines were grasped by powerful hand. Colic pains <from bending forward and while lying >on standing erect or bending backwards.

• Dulcamara: Colic from cold. Acts prominently on umbilical region. Cutting pain around the navel. Swelling of the inguinal gland.

Chamomilla: Flatulent colic, after anger with red cheeks and hot perspiration. Hepatic colic, acute duodenitis.

• Colchicum autumnale: Ascites. Borborygmi. Pain over liver region. Caecum and ascending colon distended. Autumnal dysentery; white mucus

Lycopodium: Hepatitis, atrophic form nutmeg liver. Pain shooting across the lower abdomen, from right to left. Abdomen bloated, constant sense of fermanetation, like yeast.

Mag phos: Enteralgia, relived by pressure. Flatulent colic, forcing the patient to bend double; relieved by rubbing, warmth, pressure; accompanied with belching of gas, which gives no relief. Bloated abdomen, must loosen clothing, walk about and constantly pass flatus.

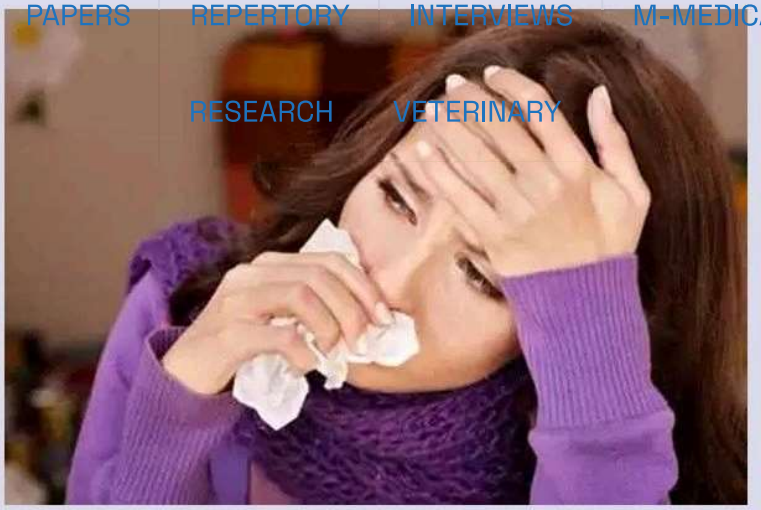
Obstinate Cough and Cold in a Woman of 31

February 18, 2023 • Add Comment • by Rajiv Peres



Dr. Rajiv Peres shares a case of obstinate cough and cold in a woman of 31. Emaciation most marked in lower extremities was a symptom that led to one of the remedies.

On 29th September 2022 A 31 year old lady doctor consulted me for complaints of cough that started the previous day. It was accompanied by dryness of mouth with thirst, mild soreness in throat. Irritation in throat was first, then cough. Cough would begin in the chest at the bifurcation of the trachea into right and left bronchus. She had the feeling that mucus was stuck at bifurcation of trachea. Itchy throat.

30th September 2022 – Dry cough with minimal sputum, sneezing and cough beginning from the throat. There is a foul odor coming from the mouth and throat. Cough is causing pain at bronchus. Drinking hot water helps itching in throat. Cough comes suddenly while inspiring.

and itchy. Cannot bear draft of air. Feeling of congestion in both ears. Expectoration is yellowish and there was also post nasal discharge. Sometimes with the sputum there is little tinge of blood.

Chest pain observed in left lower aspect of chest on and off. (father suffered T.B and mother haemarthrosis of left knee joint). She observed that expectoration is more frequent in early mornings. Voice was hoarse. Feels better by eating solid food.

Got fever (heat) since last 3 days followed by chilliness. Increased appetite with fever. Suspected H1N1. Took Nux Vomica 1M, one single dose on her own on 30th September 2022.

1st October 2022 – Lot of coughing in the morning along with coryza. Itching and soreness of throat less. Hoarseness increased. Feeling very drained. Mild fever, continuous running nose with watery coryza. Day by day feeling more and more exhausted.

Bad type of dryness of throat with increased thirst. Felt better by drinking water. Fever 100'F, frontal sinuses feeling tender with headache. Sputum thick yellow. Took head bath in order to visit the Temple, Head feels better by wrapping up including covering over face. Cough is worse on talking and while inspiring. Wheezing present. Dryness of throat marked so much so that she starts crying from the irritation. Cough with expectoration. The sputum is causing tickling inside. Sputum sometimes yellow, sometimes white and she needs to breathe from the mouth.

Took Hepar Sulph 200, 1 single dose on her own on 1st October 2022.

easy.

9th October 2022 – Cough still present. Sputum thick and sometimes thin, yellowish. She complained that she has lost weight in lower extremities only as compared to upper body. Despite not exercising for last 2 weeks, noticed that her tight jean pants are becoming loose in lower limbs.

Feeling tired easily. This time weakness was more than ever. Recalled that even during COVID (Jan 2022) and chicken pox (May 2022) that she experienced in this year earlier, she was good. Conjunctiva was pale. Haemoglobin reduced for no obvious reason.

She has started consuming tomatoes and beetroot to counter it. Bouts of cough take long to settle down. Thermally hot patient. Feeling very exhausted. More expectoration while bending down. Foul taste in mouth in the morning. While coughing feels upper chest is vibrating.

Expectoration feels stuck and relieved if she can expectorate. Has to thump the chest retrosternally to relieve herself. Now cough is starting from throat and not from bifurcation of trachea. Complaints of cough worse lying-in supine position. Prefers sweets to salty things. Has dewormed herself but no improvement. Wants to be in open air with ears covered. Voice was hoarse and unable to speak louder than whispering.

On 11th October 2022 – Suddenly she called up to speak about problems in her personal life. She informed me that her parents secretly planned a meeting with a boy and his family (marriage proposal). She thought that the boy may be visiting her

because the boy's family was so well dressed. The match maker did not even introduce her nicely to the family of the boy. She was asked to sit in one corner with the boy.

They began asking her questions: "What are your expectations?", "Will you travel from my home to the hospital where you work at present? And she was not able to reply appropriately as it was completely an unplanned event. The boy also told her that he had gone through her Instagram pictures which reflect her state of mind.

The place of meeting of the two families was also in a shabby locality. Until 3 days there was no reaction from the boy's family. Later upon asking her father she was informed that they were not interested. Now her father could not digest this and she has started isolating himself from her and her mother, sleeping separately in the same house. He was abusing alcohol and insulting her and her mother all the time. It was fully chaos at home.

She worries about her mother's and father's health. She felt greatly duped by her parents. Next day an aunt of hers came and told her to just get married to anybody, as it's a part of everyone's life. It's a contract. At last, she told me that she felt much relieved after speaking out her problem.

Anamnesis of the case done on 12th October 2022: In this the first thing to be done is to address the respiratory problem that is not getting fixed. Identify the important characteristics not only in the form of symptoms but also in terms of direction of disease, magnitude of disease.

Community Acquired Pneumonia (CAP) in a Man of 30

The problem started with tracheobronchitis as the beginning then gradually as time passed in between there was fever, some medicine taken. Now what are the things that I see very striking? If we make any mistake disease will affect her mind producing a psychological condition or much deeper pathology of respiratory issue.

At this stage we may not look into mental aspects of her condition. Prescription is not based on disease diagnosis. Anybody going through such a situation will have disturbance but it is the degree of disturbance that matters and if it aggravated the disease that is there.

The respiratory problem and disturbance of mind are concurrently running without impact on each other. The disturbance is not intense (judged by her manner of communication) and affecting day to day thinking, her decisions, her performance. Or, whether there are certain mental expressions coming out as evidence that really show that the situation is affecting her.

Events may be there with no strong effect, then there is nothing to consider at all. Don’t get confused between state of her mind, and the present condition. Two platforms are available: One is respiratory platform, the other is life situation platform.

In between lies the clinical diagnosis problem which may allow you to understand the management part. So, this is the square of todays problem. Hence, we get

sensation, modality, concomitant or you can have Boger's approach by judging pattern of response that is onset sudden, gradually progressing, Cold first settling in chest, ascending, progressively increasing and ending into weakness, or from particular level things are going into general.

But mind is not affected as far as respiratory concomitants are concerned. Do not add any interpretation of events to make it either concomitant or a mental state. We must be very careful. We have to prescribe now. We have an unresolving cough with characteristic modalities. Rubrics Considered: 1) Cough worse laughing, 2) worse talking: Arg-n, Cupr, Dros, Phos, Spong, Stann

3) bad taste in mouth in the morning. Only Arg-Nit.

Allen's KeyNotes mention in Arg-N that emaciation is most marked in lower extremities. This symptom was the anchor symptom of this case. If one looks into the core delusion of Argentum Nitricum, we realise that she feels despised and forsaken (abandoned), delusion that she is repudiated by his relatives. This is exactly the essence of our patient's life situation.

1st Prescription of Arg-Nit 200, 1 single dose administered on 12th October 2022 evening.

Follow Up on 13th October 2022– Took orange juice and later hot water. No aggravation of any complaints. Rather appetite has improved, not much cough, however slight irritation of throat present. Cough is now from throat and not from chest or bifurcation of trachea. Felt less exhausted. Came home after hospital duty and then cleaned her room, and still no drained feeling. Running nose stopped.

reduced considerably. Dreams that she was video gaming in which she was escaping something.

Follow up on 17th October 2022– Cough returned but now its from the larynx. Started after consuming some juice at neighbour's home. Intermittent cough. Worse on talking and laughing. Felt uneasy feeling in right side back as if she had some prolapse of intervertebral disc (Old symptom returning). Used to get this symptom on and off in the past. Felt better by pressure. No medicine given.

Follow up on 18th October 2022– No dry chest cough as was the case before. Cough only from throat. Stools had not been proper for long time (6 months) in the sense that not well formed and crumbled with difficulty in evacuation, needs to assist with finger. Thirst normalised and reduced as compared to last week during sickness. Tried cold things which do provoke cough.

Follow up on 19th October 2022– Overall better. Once dry cough starts gets continuous bouts which don't settle easily. Then coughs intermittently. Exhaustion has reduced by 80%. She was asked about the thinning of her legs. She said that now it has stabilised since the patient found that the pants which were loose a few days back are no longer so loose.

She was asked to monitor her haemoglobin and report. She complained of appearance of tinea like dry eruptions on right dorsum of hand which developed after exposure to sun. No medicine given.

Follow up on 23th October 2022– She complained that cough is same and feels that medicine is not taking her any further. Complained that her cough is like that of a

Tuberculinum 200, 1 single dose on 23rd October 2022. Reasons for prescription – Refer Boger's Synoptic Key: ever changing symptoms not responding to the best of prescriptions.

The prescriptions are not getting registered deeply due to the underlying miasm (Tubercular taint). Her mind is also changeable and undecided. She is interested in fashion designing but not clear of how to go about it. Obscurity of a clear-cut diagnosis also favours Tuberculinum.

Tuberculinum is worse by motion (talking, laughing), worse by exertion, better in open air. This patient had pattern of lowered vitality. H.C Allens keynotes we find "Takes cold easily without knowing how and where".

See also

Solution to last month's Case of 'Spino Cerebellar Ataxia'

Follow up on 24th October 2022 – She got stinky loose motions. Watery, 4 times since early morning. (Tuberculinum has 5am aggravation). Felt drained. Same night felt mild cramps in transverse colon. Has to pass stool if eats anything. Advised probiotic and oral rehydration solution.

25th October 2022– Cough became more bugging as before and diarrhoea better. Cough without any expectoration mostly in the morning. Felt poking pain and unable to pass flatus.

29th October 2022– Cough is 90% better. But in the morning, she saw a small eruption with mild itching. Was reassured that response is positive and that skin will not flare up like in the past. Explained that this is as a result of medication and not relapse of the disease.

3rd November 2022– She had a bad dream, in which some young male person is chasing her to kill her, the reason being that she is a non-Muslim and she tries a lot to dodge him, but in the end, gives up. There is another unknown girl with her and they were in some city with complicated buildings and complicated corridors.

He chases them with intention to kill. They both run and hide behind window and through toilet hole of old-fashioned toilet, then the girl asks her to bathe in some lubricant oil but the girl gets shot and dies. She tries all tricks even by taking someone's car but still she gets caught.

He had some weird gun like blazing fire and heat coming out. Like the ones used for welding. Then she chooses to go close to him and act as if she will wrap her arms around him and he fires. Before she could feel the pain, she woke up. She said that in the whole dream she was thrilled about the escape part and not scared in the least. She wanted to win; it was like a game.

Follow up on 7th November 2022– Feeling alright. Cough occasional only on excessive laughing. Tummy feels bloated once again. Stool slender and crumbles, needs to use finger to widen the anal opening. Drinking less water.

Follow up on 10th November 2022– No emaciation of lower limb, No cough, No skin

girl.

Complaint of losing temper soon. This happens usually one or two days before menses. But it has been 4-5 days. Gets highly irritated. At home she tries her best but at last she blasts as she cannot control. At work, tries to keep quiet or not to give opinion since she speaks very sharply.

She even taunted her boss that now “don’t speak sarcasm”. At the moment, she cannot bear the slightest contradiction, it angers her. Hence tries to keep away. She also understands that her bad behaviour is spoiling other people’s mood since they get offended too, just like her.

Irritated for example, if she is not told all the details or if somebody forgets what she had said earlier. Today she skipped her lunch on account of her stubbornness. Her boss had promised to offer lunch but at last minute he forgot. Complaint of gaseous distension. Not able to pass flatus easily, worse morning and evening. Stool slender, crumbles, scanty and has to use her finger to widen her anus.

It’s been one year that she has passed a good formed stool. Desires sour tangy foods. Uses lime over salads. When upset or sad, cannot even weep freely. At that time consolation aggravates and she wants to be by herself. Cannot bear draft of air from Air conditioner it results in headache. Desires hot food but prefers cold drinks. Face is dry, lot of dandruff.

1)Angry before menses 2) Stubborn 3) Sadness worse consolation 4) Cannot have opposition Cham, Caust, Kali-c, Lyco.

Follow Up on 4th December 2022: L.M.P 12th November 2022. Feels overall okay. No respiratory problems, no upper GI issues. But the end of November started with bad hair fall (old symptom). Scalp dry and dandruff present. No constipation if consumes vegetables, sometimes has to strain at stools but better in the last 5 days. No complaints as such. No medicine given.

Follow Up on 6th December 2022: Got her menses on 4th December 2022 this time pain was not bad at all, rather bearable. No troublesome PMS this time. On second day of menses watery coryza began with slight sore throat. Frontal and maxillary sinus slightly tender. Doesn't want to get exposed to draft of air nor wants fan. Desires to cover her face and ears. No medicine required as by next day coryza reduced on its own. No Cough.

Lessons: Acute remedies may relieve the fever or cold symptoms temporarily, but unless the PQRS symptoms and the mental concomitants of the case match with the remedy indicated from the homoeopathic materia medica, an actual recovery doesn't occur. Here the susceptibility of the patient was good providing clear cut indications of different remedies.

Abstract: *The author presents a case of migraine where constitutional medicine was ineffective but an acute remedy helped her instantly giving a lasting permanent cure.*

A 24-year-old unmarried female clerk, visited on 4th August 2017 with c/o catching cold very easily with continuous sneezing and nasal obstruction worse at night. She also c/o recurrent headaches which began in the morning and lasts till evening since last 4 years; headache improved after sour vomiting . Other complaint was pain in the thighs and shoulders which the orthopedic doctor had declared as calcium deficiency. In the morning after waking up from sleep, her back would also hurt. In past history it was noted that she had a certain allergy of the eyes that had begun in class 5 and she has been taking treatment for it for last 10 years. Her eyes would specially itch in winter season. She desired raw mangoes and preferred cold drinks. She had aversion to milk+3. She could not tolerate spicy foods. Thirstless and chilly. No problem with stools.

She wore a sweater even on a hot summer day. She would be angry if her wishes were not listened to. She was especially concerned about her family because her father was not bothered about them and was worried about having a heart ailment. She would often tremble with fear. Her greatest desire was to have a good family life. She had problems in taking decisions due to confusion of mind. She also had anxiety of making mistakes. She never shows her sadness and felt better after crying. She was fond of slow music and so sensitive that she can't bear to see fights. She used to feel tired easily. This was a typical psoric constitution with general emaciation. Hence, *Calc-c* 200 single does was prescribed on 4th August 2017.

Follow up

- **11th September 2017**: Thigh pain and shoulder pain 80% better and no backache anymore. But she was still very desperate to get rid of her nagging left sided migraine headaches, which recurred every Sunday. Headache < eating and > vomiting+2 something sour. Pain was sharp type, no radiation but occurring periodically, < hot weather, > lying down but at that time she cannot fall asleep. Headache > gentle motion. Her eyes were red with the headache this afternoon. BBCR Repertory was referred for the following two rubrics:
- Head internal occurring every 7th day; Calc, gels, *Iris,* phos, saba, sang, sil, sul, tub.
- Head internal Vomiting Amelioration; Asar, Eupper, Ign, Iris, Tab.

Iris-versicolor is the finest medicine for gastric or hepatic headache associated with sour vomiting with prominent action on alimentary tract says EB Nash. William Boericke mentions the modality better by continuous motion.

Iris-versicolor 200 single dose was prescribed on afternoon of 11th September 2017 during acute attack. Within 2 minutes the headache disappeared.

15th June 2018: She got the headaches only once a month for the first 3 months but not as intense as before. After that no single episode of migraine. No shoulder nor thigh pains. No complaints whatsoever. Happily married.

12th February 2019: No headaches. Complaints of constipation, hard stools. Cold hands with numbness. Lumbago with excessive menses. Chilly, Fear of darkness, worried about future and family. Neck pains. Still prefers sour foods. Knee pains worse ascending. *Calc-c* 1M, 1 single dose prescribed.

LEARNING: Although *Calc* was her constitutional medicine, yet it was ineffective in dealing with this obstinate migraine tendency and an acute remedy like *Iris-v* helped instantly as well as to give a lasting permanent cure.

KEYWORDS: Acute left sided migraine, Sour Vomiting, Constitutional, *Iris-versicolor, Calc-c.*

Marriage is a burden

Abstract: *A classic case where an acute emotional imbalanced response was triggered in an individual in response to things done by others. The problem arose in the mind, but the body is expressing the same pattern freely.*

A 27year old unmarried male presented on 5th of March 2023 with c/o bleeding after stools (20 to 25 drops of bright red blood). No pain whatsoever. No constipation. First time bleeding appeared on 28th February 2023 in form of a streak of blood on the stool, especially towards the end of stool 2 drops of blood were noticed by the patient. On 2nd March 2023 soft stools but 5 drops of blood were passed at end of stool. 2 days later, 4th March 2023, he was stunned to see 20-25drops of blood at end of stool and stools mixed with blood. Painless stools. He was worried. When I saw him, he appeared upset. When I inquired into how it all began, he informed that on 11th February 2023 while playing a friendly football match he fell down and sustained blunt injury to his left knee. Initial swelling of left knee reduced after ice application. After this he observed a firm mass protruding from lateral aspect of left knee specially when he squats on the Indian toilet. On 14th February 2023 Valentine's Day he met a girl whom he was chatting for last 3 months. She seemed equally promising to him, but he maintained some distance from her as he had just met her. Later, while chatting next 2 nights, she inquired from him 'What do I mean to you?' He knew that another boy was after her, so he replied diplomatically saying that "you are like a colleague." This offended the girl, and she immediately disconnected the phone. She messaged him that "I won't sleep all night." When he inquired the reason, she replied "That's none of your business". This shattered him completely. He felt as though someone had hit his brain with a hammer. He could not stand this insult. It made him furious to see such an insensitive reply from a girl whom he loved and cared for. He switched his phone off and diverted his mind so that he might be able to get sleep. Next morning, he found a message from the girl 'Goodbye Forever'. This added to his misery. Soon he had a toothache, < inhaling cold air into mouth. No caries visible. He felt extremely offended and sad. He was just unable to forget the girl and her insult. From the next night onwards he could not sleep soundly. He would be awake till 2-3am and be sleepy during the day. He would wake up several times at night to pass urine or simply to check the time or was woken by wet dreams. Sleep was unrefreshing and even if he tried to sleep during the day, it could not refresh him for long. Always yawning. Usually, he hates smoking because the taste of nicotine doesn't go even after brushing several times but on 17th February evening as he smoked on insistence of a friend, he quite enjoyed it, and the taste did not bother him at all. On 20th February 2023 He met his ex-girlfriend on pretext of some work and asked her

to hug him, but she point blank refused and walked away. He was enraged at her behaviour but never showed it externally. He decided to teach her a lesson later. On 3rd March 2023 he was accused by his best friend for spoiling the sacred environment of the gathering of people- why?. He once again felt very bad but shut his mouth and walked off quietly. Next day he had an indurated fiery red pimple on left cheek and tip of nose. At the end of it all he felt that everyone wants to injure him. At work, since his sleep was incomplete, he would shout at others. Picking up quarrels. Refusing to follow orders. Insulting his siblings and mocking his colleagues. However, if his colleagues pointed out his flaws or contradicted him then he could not tolerate it. While travelling he would be very cautious to see if any vehicle might hit his injured knee, although there was no tenderness nor pain in it. He would often keep his hands on his knees as if trying to protect and cover it. He felt his legs were not supporting him well, hence while climbing stairs he would firmly hold on to the railing to make sure that even if he slips, he will latch on to the railing. He said that he was feeling like an old man while walking, like being unsure of his stability. He also got a boil just below his suprasternal notch with pus that oozed out and it healed leaving a keloid like scar. He could not bear much noise; it would anger him and then he would shout very loudly. Later, he felt guilty for having shouted in anger. His teeth and throat were also sensitive to slightest change in temperature of water (cold water) and in the mornings he would have a running nose on waking. Chilly, good hunger, can eat more even if has just eaten a meal. He felt lonely and wanted somebody to make love. He enjoyed watching girls pass by on the street (Lustful). He would speak everything in double meaning, but shy at the same time when it comes to practically doing it. On inquiring whether he felt anger, insulted or sad? He immediately replied that first he felt insulted and felt that his honour was wounded by both the girls and later on he felt sad thinking repeatedly 'How could they do this to me?'. I referred Dr RP Patel's corrected version of Kent's repertory for the following rubrics 1) Effects of honour wounded *(Ign, Nux-v, Staph*) 2) Lasciviousness

We have a choice between *Ignatia* & *Staphysagria*. Oversensitive to rudeness, easily excitable, highly emotional, worse from emotions, image conscious with vexation and reserved displeasure, insomnia after grief, we find in both. But the expression of toothache as a result of constant grinding of teeth in anger, prominent masseter's, sensitive to cold water and always angry are guiding features of *Staphysagria*. Boger's synoptic key mentions pains that move into teeth, imagines insults. HC Allen's keynotes says under *Ignatia* that it cannot bear tobacco smoking and under *Staphysagria* we find craving for tobacco. According to Boericke's Materia Medica in *Ignatia* we find painful haemorrhage after stool and stools are passed with difficulty, which is not the case with our patient. *Staphysagria* in Boericke's cites the symptom; dwells on sexual matters.

Prescription given on 5th March 2023 *Staphysagria* 1M, single dose.

Follow up

8th March 2023: Not a single drop of blood in stool ever since he began the homoeopathic medicine. Besides this, sleeping very deeply and waking up refreshed every morning. No longer short tempered or angry mood. Peaceful at workplace.

15th March 2023: No relapse of sleeplessness nor bleeding during stool. Feels strong in the knees and resumed daily walks. No longer worried about sustaining injury to left knee. On two occasions, was able to bear unwarranted insults from two different colleagues but did not retaliate. Later on, one of the colleagues apologised to him and made peace, the other colleague he forgave without holding any grudge. Gets acidity if overeats and realises importance of exercise.

LEARNING: This is a classic case where an acute emotional imbalanced response (Anger=hate) was triggered in an individual in response to things done by others. The problem arose in the mind, but the body is expressing the same pattern freely. Somatization occurs in *Staphysagria* as a result of suppression of emotions & hidden anger especially revolving around relationships. *Staphysagria* has pronounced action on Nervous system with great sensitiveness to least impression, either mental or physical. Herring calls this as Morbid sensitivity as he is fixed on insults (Sycotic). Least word seems wrong, hurts him very much, special senses become irritable, cannot tolerate noise, everything is painfully sensate.

KEYWORDS: Bubbled up---injured pride---high libido--- *Staphysagria.*

A Restless Soul

Dr SHREYA K MEHTA

A young man, 25yrs, came on June 18, 2018, complaining that he hadn't been able to eat in two years. He throws up if he consumes one extra roti. He has numerous plans, and if they don't work out, he immediately loses his appetite. Can't concentrate on one task at a time and is distracted by other tasks, leaving the earlier task unfinished and causing anxiety and hasty labour. Eats quickly. Believes he will throw up if he eats too much. He works for an IT firm; if requested to give a 30-minute presentation, he becomes exhausted before the end of the period, breathless, frets about what to do if the material ends quickly and lacks confidence. If the presentation is unsuccessful, performance will suffer, and there won't be a promotion or appraisal. He met a girl in 2015 with whom he had a meaningful relationship. He tried to propose to her, but she declined. He stopped eating as a result of the event, and he started waking up during the night. When he learned of her marriage to another a few months later, he found it difficult to accept the information. When questioned about their relationship, he responded that he made every effort to be there for her, used to travel great distances to see her, and would talk to her about his personal issues. But after being turned down, he gradually came to believe that money is the only thing that matters. He didn't have a good income back then. The only thing he could think of was, "Why not me? Is it true that I'm insufficient for her?" I made her my top priority and kept her above everyone else. I was upset about how far behind I am in my finances and appearance. She might think I'm stupid or that I'm unfit to be with her. Am I not that presentable? Perhaps the other man she married was more intelligent and well-groomed. I am unable to focus or adequately eat after that occurred.

If I try to plan anything, it never works out. I also suffered a substantial financial loss due to Bitcoin. Again, I didn't accept the loss. I made an effort to make up any losses I suffered. I make a lot of plans,

'Antagonism with Herself' from Kent's Repertory

Dr. Rajiv Rui Viegas Peres

ABSTRACT

"Antagonism with herself" means hate or extreme unfriendliness or active opposition to oneself. This is a subjective symptom seen in four different remedies found in Repertory of the Homoeopathic Materia Medica by Dr. J.T Kent, sixth American Edition corrected, revised and improved by Dr. Ramananlal P Patel. This article is to explain how the four different remedies (Anacardium, Aurum-Met, Kali-Carb & Lac-Can)1 given in Kent's repertory under the rubric, Antagonism with herself can be comprehended in context to homoeopathic psychology with the help of examples from my clinical practice.

Keywords: Antagonism, Sadness, Pathogenesis

INTRODUCTION

Many a times we find rubrics in our homoeopathic repertories specially from mind section, that are extremely difficult to comprehend at first hand, but a deeper reflection along with co-relation of knowledge of psychology to homoeopathic materia medica and further integration of it with Rubrics from repertory finally yields clarity and then these rubrics become usable in our day-to-day clinical practice. These rubrics could also be understood from a miasmatic perspective but that requires strict individualisation.

Anacardium: It has not only weakness of mind, but weakness of all the senses (illusory unpleasant smells [6]), weakness of body, paretic weakness of rectum. Lack of power: mental and physical[2]. Dull emotions, laughing at serious matters but maintains a serious demeanour over laughable things. This shows that sadness often hides behind such contradictory behaviour. Here is a split personality[5] (feels and thought has two wills, one commanding to do what the other forbids; thinks is double; sense of duality) demonstrates exactly opposite behaviour unexpectedly, without any apparent reason, from acts of goodness to the most evil acts known to humankind. Want of moral sentiment "Moral Inferiority": Characterized by impiety, hardness of heart, cruelty. Malicious; seems bent on wickedness. Easily offended and he is overcome by sudden rage and panic, leading to having stabbed someone. Upon asking why they behaved this way, they answer: 'I can't help it, someone makes me do it', expressing the delusion of being possessed. These aspects reveal a lack of control and much confusion in the patient's behaviour as well as the fixation of being separated from the world because of the battle between two wills. This will lead to an obstructed personality, a lack of ego growth or what we call psychic arrest. Parental domination is one of the most common triggers of an Anacardium state[5]. Lack of confidence in himself and others[3]. Suspicious[4]. Circumstances giving rise to these mental states are when the parents of a young child divorce. Conflicts between parents in the presence of the child creates immense fright and confusion as the child loves both parents; the child now becomes a split personality, choosing one parent one moment, then the other the next. This break-up of his family creates not only confusion, but also creates guilt. Childhood crime has now created a dysfunctional adult (Swearing, obscene and lewd) violence and rage. They become a threat to others-Syphilitic symptoms.

Aurum Metallicum: An extremely conscientious and industrious person living idealistically by making personal sacrifices faces false allegations crushing his self-ego then he constantly dwells on suicide[6] and desires death (Constantly loathing of life). Gold is an emotional remedy. What

to live for? Neither pain is remaining nor love. To live one needs a motive for example in order to take revenge or to live to achieve somebody's love. Aurum has lost the reason to live. Never well since: Retirement[5] (may fall into great depression, not able to see himself in the mirror, he feels that he has lost affection of his friends, feels unfit, boredom, anxiety, irritability, succumbing to a heart attack, and even suicides are common consequences), disappointed love, loss of money, hearing bad news, sudden loss of employment, loss of longtime partner, being scorned, reserved displeasure[3], violence. Thereafter he feels "I did not do enough, that's why I failed" (delusion, he has neglected his duty[5]). Self-condemnation[4], self-criticism. Contradictory symptoms found are that generally Aurum-met symptoms are worse at night but eye symptoms are mysteriously better in moonlight. In liver and heart complaints of Aurum one finds despair and hopelessness[2], but Hopefulness is found with lung complaints is another unique feature of Aurum. Persistent thoughts about death (thinking of self-destruction, cutting their wrists with a knife, survival is difficult because he has fallen in his own eyes;Mental degeneration[4] (Syphilitic destructiveness). Recently I came across a case of P.C.O.S a girl of 22 years who had to own responsibility of caring for her three younger siblings due to the sudden untimely death of her mother from postpartum haemorrhage. Her father remarried and separated from them. Now she is working to educate and feed the younger siblings out of great sense of duty but her younger siblings don't give her respect nor acknowledge her sacrifices, she has to cook, clean everything despite her work as a quarrelsome receptionist. She wants respect but as she doesn't get it out of frustration, she has attempted suicide four times already by cutting her wrist, but due to lack of courage and concern for her sibling's well-being she hesitates to die and didn't succeed. Her life oscillates between living for care giving towards siblings and tired of living due to no honour from her siblings and desiring death.

Kali-Carb: Has been raised with good initial family teachings all his childhood and that becomes a complete world for him. Later on, he simply follows those precepts. He continues his further life on same path firmly like a sober Mummy's Boy, cannot be easily influenced by anyone (Friends, distractions) easily. He has tendency to follow the rules. Will live his life as per the foundation laid down by his parenting. Family value, concern for the family is of highest importance in kali-carb. But once in any point of time there is a contradiction with its family teaching, family values and its outside survival, Loss of dependency develops pathology centred on paralytic type weakness of backache[2] (Back is support of life to stand up in life). Complaints settle in throat (Kent). Subsequently the respiratory disturbance arises. Dreams of fighting with parents or close relative reflects the parental conflict. Hence, we find intolerance to solitude (need for support, being heard to) as well as aggravation from consolation (He already knows everything as he was raised idealistically and doesn't require advice, very irritable[4,] oversensitivity, touchiness, sensitive to every change in weather[6]). Any sort of crisis especially at psychic level, any sort of anxiety settles and reflects in the stomach. Bad news will give uneasiness, nausea and hollowness in stomach. Opposite symptoms found in kali-carb is that extreme chilliness is found everywhere but its haemorrhoids produce heat and burning pain relieved by cold application. Whereas all symptoms of Kali-carb are having aggravation from cold in general. Normally when man eats, he gets warmed up and energised but in Kali-carb we find lethargy, lost strength and going into sleep state while eating. One of kali-carb's principal aetiologies is from sexual excess, a part of her duty towards her family[5](Procreation program with tendency to obesity[6]). Its toothache aggravates while eating. Hahnemann calls Kali-carb as a medicine of great strength to treat the deepest level of psoric diseases[3]. A case of 57-year-old headmistress who is the sole bread earner of the family, suffering from panic attacks at night due to anxiety of pressures generated by the college management and her dream profession of being a master of ceremony and life coach which is not allowed as per norms of college managements. She cannot give up her job as family needs will be at stake hence, she has to force herself to work every day and hidingly carry out her mike compering sessions for people's weddings and celebrations. Her struggle is between means of survival where

she has to protect her energy and on the other end to focus on herself in pursuit of her own dream as an entertainer.

Lac-can: Thinks himself to be of little consequence "I am worthless" reflects a state of low self-esteem. This mental state develops when someone is treated badly by a 'Wicked stepmother' a case of deliberate neglect from early childhood.As this medicine is procured from milk of bitch so it faced lot of criticism from homoeopaths before its use. Poor social training and being excluded from social events leads to unnecessary defiance. Parental or spousal abuse are the causality but Lac-can's anger and rage are directed at the self[5]. She feels insulted because she thinks she is looked down upon by everyone, she imagines being dirty; she imagines horrible mass of incurable disease[4] and could not bear to look at any portion of the body as it intensifies her feeling of disgust and horror. This person who feels isolated in a threatening society in which there is no sense of love and belonging has to fight and struggle for her existence. A struggle to convince others of one's own value and worth. Lac-can is stuck in her emotions, leading to irresolution: absent minded[6]; makes purchases and walks off without them. Extremely nervous and irritable, attacks of rage, cursing and swearing at slightest provocation[3]. Shows great sensitivity, shyness, inability to express direct aggression. This genuine sadness is intensified and expanded into self-hatred (Antagonism/ aversion to herself) and depression enacted in her psychotic world through voices and hallucinations. This person hovers around the danger line between neurosis and psychosis reflected as a delusion, out of body, she is hovering in the air like a spirit. This is called depersonalisation[5]. Later on, she questions herself if she has the right to exist, followed by suicidal ideation. Symptoms erratic, pains fly from one part to another[2]. What forgetfulness is in the mental plane, likewise shifting pains is a type of forgetfulness at the physical level of location where pain had settled earlier. Forgetfulness is not due to carelessness of mind, rather it is a fixed and pathological state. Its forgetfulness is greater than anacardium and even greater than medorrhinum. Tubercular taint is seen in this remedy. Breast inflammation aggravated by least jar and must hold them firmly when going up and down stairs[3]. Pain in the opposite breast while feeding. Oversensitive to touch; cannot bear one part of her body to touch another yet hard pressure ameliorates is also an antagonistic aspect. A case of a household maid, single mother with three children living in master's house suffering from hypertension and forgetfulness (When it comes to totaling bills of purchases unable to recollect anything, forgets when food is placed on gas cooker-Absent minded) due to constant conflict created by other senior maids of owner's house who envy her importance in the house, this generated anger inside her. She is split between too much responsibility of work as a maid with the politics around and responsibility of three children's education and their careers.

CONCLUSION :

Antagonism with oneself is an inherent trait in these above-mentioned remedies as per Kent's repertory, the underlying miasm and environmental stimulus help to maintain the disease and contribute to the pathogenesis. The psychological evolution of these remedies is what is my attempt through this article.

Hence, we find intolerance to solitude (need for support, being heard to) as well as aggravation from consolation (He already knows everything as he was raised idealistically and doesn't require advice, very irritable[4,] oversensitivity, touchiness, sensitive to every change in weather[6]). Any sort of crisis especially at psychic level, any sort of anxiety settles and reflects in the stomach. Bad news will give uneasiness, nausea and hollowness in stomach. Opposite symptoms found in kali-carb is that extreme chilliness is found everywhere but its haemorrhoids produce heat and burning pain relieved by cold application. Whereas all symptoms of Kali-carb are having aggravation from cold in general. Normally when man eats, he gets warmed up and energised but in Kali-carb we find lethargy, lost strength and going into sleep state while eating. One of kali-carb's principal aetiologies is from sexual excess, a part of her duty towards her family[5](Procreation program with tendency to obesity[6]). Its toothache aggravates while eating. Hahnemann calls Kali-carb as a medicine of great strength to treat the deepest level of psoric diseases[3]. A case of 57-year-old headmistress who is the sole bread earner of the family, suffering from panic attacks at night due to anxiety of pressures generated by the college management and her dream profession of being a master of ceremony and life coach which is not allowed as per norms of college managements. She cannot give up her job as family needs will be at stake hence, she has to force herself to work every day and hidingly carry out her mike compering sessions for people's weddings and celebrations. Her struggle is between means of survival where

she has to protect her energy and on the other end to focus on herself in pursuit of her own dream as an entertainer.

Lac-can: Thinks himself to be of little consequence "I am worthless" reflects a state of low self-esteem. This mental state develops when someone is treated badly by a 'Wicked stepmother' a case of deliberate neglect from early childhood.As this medicine is procured from milk of bitch so it faced lot of criticism from homoeopaths before its use. Poor social training and being excluded from social events leads to unnecessary defiance. Parental or spousal abuse are the causality but Lac-can's anger and rage are directed at the self[5]. She feels insulted because she thinks she is looked down upon by everyone, she imagines being dirty; she imagines horrible mass of incurable disease[4] and could not bear to look at any portion of the body as it intensifies her feeling of disgust and horror. This person who feels isolated in a threatening society in which there is no sense of love and belonging has to fight and struggle for her existence. A struggle to convince others of one's own value and worth. Lac-can is stuck in her emotions, leading to irresolution: absent minded[6]; makes purchases and walks off without them. Extremely nervous and irritable, attacks of rage, cursing and swearing at slightest provocation[3]. Shows great sensitivity, shyness, inability to express direct aggression. This genuine sadness is intensified and expanded into self-hatred (Antagonism/ aversion to herself) and depression enacted in her psychotic world through voices and hallucinations. This person hovers around the danger line between neurosis and psychosis reflected as a delusion, out of body, she is hovering in the air like a spirit. This is called depersonalisation[5]. Later on, she questions herself if she has the right to exist, followed by suicidal ideation. Symptoms erratic, pains fly from one part to another[2]. What forgetfulness is in the mental plane, likewise shifting pains is a type of forgetfulness at the physical level of location where pain had settled earlier. Forgetfulness is not due to carelessness of mind, rather it is a fixed and pathological state. Its forgetfulness is greater than anacardium and even greater than medorrhinum. Tubercular taint is seen in this remedy. Breast inflammation aggravated by least jar and must hold them firmly when going up and down stairs[3]. Pain in the opposite breast while feeding. Oversensitive to touch; cannot bear one part of her body to touch another yet hard pressure ameliorates is also an antagonistic aspect. A case of a household maid, single mother with three children living in master's house suffering from hypertension and forgetfulness (When it comes to totaling bills of purchases unable to recollect anything, forgets when food is placed on gas cooker-Absent minded) due to constant conflict created by other senior maids of owner's house who envy her importance in the house, this generated anger inside her. She is split between too much responsibility of work as a maid with the politics around and responsibility of three children's education and their careers.

CONCLUSION :

Antagonism with oneself is an inherent trait in these above-mentioned remedies as per Kent's repertory, the underlying miasm and environmental stimulus help to maintain the disease and contribute to the pathogenesis. The psychological evolution of these remedies is what is my attempt through this article.

Case 1 of Chronic Sinusitis with trapezitis

Abstract: This is a case of an old looking artist who presented with sinusitis as a presenting complaint but it was later revealed that he was obsessed with sex but had to suppress his drive due to ill health of his girlfriend. Staphysagria helped to relieve his trapezitus as well as sinusitis related headaches.

Keywords: Suppressed sex----Anger violent----Staph

Introduction: Sinusitis may be a common clinical condition and habit of smoking here acts as a maintaining factor but unless this kind of addiction is covered up by the indicated remedy his craving for smoking cannot be controlled.

A 41year old Artist (Tubercular built) visited my clinic on 18th June 2020 with complaints of trapping of some nerve along the upper border of left trapezium muscle since about 1 year. Pain was as if dislocated and >stretching. Even at night he would do stretching for long hours. He had neck pain issues since long and left sided migraine headaches since last 10 years headaches were at times very severe and he could not bear any noise, photophobia however he would have high sex drive. Headaches were due to recurrent sinus problem, since childhood. He loves having a lot of sex. Sex relieves his headaches. Although he didn't have any sexual problems, he highlighted the thing that he is very sexy and that any problem can be sorted out by having sex. His matra was "Sex is the solution to all his problems". His girlfriend complained of his high sex drive that he fights with her if she cannot have sex due to menses. He also has left hand numbness which doesn't permit him to play the guitar. He was so reserved that every question that I asked him, he would twist it and throw it back on me. His girlfriend admitted that he is good at covering up. It was very irritating to the physician the manner of his replies. When asked about anger he denied it out rightly and

said that anger transcends and that why should one react without need arising but his girlfriend confirmed that he had punched the refrigerator and the wall in anger and also broken several mobiles when they would fight or if he felt frustrated hearing her comments.

He is clean by habit and his girlfriend would ask him to clean the dishes. He would always talk in riddles and say that nobody understands him but if they don't get it it's okay. He said he didn't feel bad. But his girlfriend reminded him that whenever she insulted him then he would snap back. He was not talking to his two sisters who live in the village. He said that he doesn't need that. He travelled the world alone. He had no friends. When he met his girlfriend, he was very sad. Presently He lives with his girlfriend and said that his only fear is that she might leave him. He would contradict his girlfriend and justify his action assertively when she complained that he has habit of playing mental games. He knows how to get the truth from her by asking seeming irrelevant questions. When she met him 10 years ago, he was a strong believer in God but then something went wrong and now he exists without religion. In the past he had attempted suicide twice by consuming sleeping pills due to girlfriend's relationship problems. He was prepared to kill anyone who might threaten to harm his girlfriend.

History of dashing against the door and suffering from a seizure. He had a good timing for humour. His lips and teeth were dark due to smoking 6 cigarettes a day as he was trying to give it up. He could be very creative with light decoration or quick to learn things but should be in a mood. 2 years ago there was a time where their relationship was strained and as they were fighting he ran naked in the colony (He says that was a way to gather attention), she thought that he lost it and wanted to leave him but he pleaded her to stay. He confessed that he is very content with life and said that he doesn't think much as if one thinks much then one ends up taking wrong decisions. And one who thinks fails to act hence all time should be spent in acting. So directly act. He said my girlfriend thinks that I am serving her but actually she is the one who is serving him. There was a lot in his past but he was unwilling to reveal said that it was a long story and doesn't want to remember it. His girlfriend told that he is very emotional and gets influenced easily. His needs were eat, sleep and sex. Sex is the most important he stressed. He was fond of sweet things +2 and spicy also. Hot patient. His mother expired of Pulmonary tuberculosis and the doctors operated her and fucked her lungs. Father is only having hypertension. He fights for injustice only if it directly concerns him or his girlfriend. His girlfriend had health issues due to which she could not satisfy his sexual appetite for the last 2 years and hence they were always quarrelling. He also has complaint of numbness of left toe specially while riding the car. Repertoriation 1) Fear his wife will desert him 2) Throws things in anger. **Staphysagria 200**, 1 single dose was selected also because of the suppression of sexual desire on account of his girlfriend's ill health and due to shamelessness of sexual matters whereas otherwise he is a very blocked person.

Follow up after 25 days- Neck pains reduced not gone as yet and still feels need to stretch the neck, but overall, he's sinus attacks have reduced to much less as well as his headaches and he is not as restless as he used to be.

Discussion: Usually, these types of individuals are never seeking self-help. It is always a loved one who forcefully brings them for medical treatment. We find in his family history strong tubercular-syphilitic taint which predisposes him to have a tubercular diathesis.

Conclusion: Sinusitis can be helped by constitutional treatment which in this case was achieved with Staphysagria remedy.

Case 2 of PCOS

Abstract: This is a case of a teenage girl balancing between her demands of romantic love and love from parents and family. The insults from parents due to disapproval of the boy selected by her leading into PCOS complaints.

Keywords: Honour wounded----Anger suppressed----PCOS

Introduction: This case shows the struggles faced by a girl if she dares to choose her life partner and specially the added opposition imposed by her own family members generating negative feelings and suppression of menses.

On 8th July 2019 a 21 year old girl presented with complaints of Poly cystic ovarian syndrome since last 4years. Menses irregular. Complaints of constipation and bloating. In June month she did not have her menses. There was lot of pressure and worry about the future as her studies were coming to an end and she desired to be independent and settled. She was in love with a boy belonging to a different religion and her own mother humiliated her in front of society by spreading false stories that she is about to split up from her boyfriend since she had heard them arguing over the phone. Her mother tried to initiate proposals for her, also brought the priest home and sprinkled holy water assuming that her boyfriend had done black-magic to win her daughter. Her mother was damaging her image since last 5 years, this subjected the patient to undergo lot of humiliation and she felt like slapping her (But cannot out of respect for her mother).

Usually, she is the type who confronts directly people who spread rumours face to face. Her father was her support in the beginning but now she realized that her father had leaked out her secrets to her mother. Both her parents had disrespected her boyfriend by not inviting him to their home when he was in need of shelter, rather they insulting him. She cannot accept that her parents have disrespected her boyfriend. Now her boyfriend has gone abroad to earn money for their future. Still, they are questioning his intentions and suspecting that he will cheat her. Since childhood her mother has dominated her. Her elder brother is always

favoured and he can bring his girlfriend home and stay although they are not yet married and even physical relation is permissible because she has given full liberty for him. He can even call her with bad names and she doesn't have a problem. This brother of her used to molest her when she was small and when she reported it to her mother. Her mother told that she must be telling lies. Since then her brother is very rude to her and doesn't want to give her any right to ancestral property. She hates the presence of her elder brother.

She fully understands that they are all waiting for her to leave. With all this going on in her mind she wonders where is her respect as a daughter. She has fear of becoming insane (daily stress), fear of losing her father, her boyfriend and being alone. By nature, she is very short tempered and highly emotional. She can't bear injustice, cannot forgive nor forget. When feels she is being attacked, she walks away, isolates herself and chooses not to talk to anyone and act rude and tough. Feels very lonely and depressed. Does not cry much like before. Consolation aggravates. Her mood is changeable and she wants her freedom. She is fond of sweets and peanut butter. Hot patient, thirstless. Considering her Anger with silent grief, The wounding of her honour and sensitive to injustice. I prescribed **Staphysagria 200**, 1 single dose

Follow up after 6 months- Got her menses 20 days after beginning the medicine. USG abdomen was done but it still showed PCOS. No menses in August, September 2019. She complained that her brother was plotting against her. Her menses stain was difficult to wash, she had become mistrustful about everybody, Time passed slowly, her memory was failing. When she used to be alone in the room, she used to feel that something is around her. There was desire to travel and went for a trip to Kashmir, not once her mother phoned her to inquire how she was. Here she got sexually involved with her boyfriend and developed tremendous fear of pregnancy. She also had craving for apples+2, Oranges+1. Hot patient with fear of existence. Considering the above state I prescribed Medorrhinum 200, 1 single dose

Follow up after 3 months- No menses still. There was lot of pent-up anger seen on her face which she was suppressing. She craved for peanut butter. Loss of weight to 59 kgs due to stress, earlier she was 70 kgs. I prescribed her **Staph 10 M**, 1 single dose and advised for USG of abdomen.

Follow up after 4 months. Got menses regularly. Felt calm.

Discusssion: Higher potencies were preseferred because this girl was affected at the level of emotions and honour, insults of long standing require dynamism in medicine to hold and health. As the totality changed so also the remedy was different, however Staphysagria stood out as the constitutional remedy for this case.

Conclusion: Staphysagria harbours lot of insults, anger with silent grief, emotional causes of diseases (Psycho-somatic diseases). Remedy helped to restore the menses.

Case 3 of Stye on Right eyelid

Abstract: This case is an example of psycho-somatic development of style as a result of ego hurt due to deprivation of recognition from his superiors.

Keywords: Humiliated----by superior----result stye

Introduction: Catholic priests live by vows of chastity and service at community level. They are assigned tasks by their superiors and it is the superiors that validate their work by apraisals.

on 25th May 2020 a 38 year old catholic priest presented with complaints of pain and swelling in right eyelid,<moving the eyelids, cold feeling in right eye since 3 days, Feeling as if sand is there in the right eye. >warm application. He was hot patient and thirstless. He is diabetic since last 2 years. Problem began after conflict with other priests; the senior priest sidelined him while preparing yearly planner of events for their Parish. He felt very humiliated. He announced a 1 month vacation and left for home. Although he was at home yet he was unhappy. Could not accomplish any work. He also complained of a scratchy throat since today morning with feeling as if someone is chocking him from inside. Also another younger priest had recently joined and wanted to have his bedroom as it was very spacious. He out rightly refused it. He had an old aunt whom he looked after. As a priest he had given his 100% to the betterment of the parish however he could not tolerate this injustice and had almost decided to resign from his profession. Luckily another spiritual guide advised him to stick on. He was very angry but had to shut his mouth. Every suggestion he gave was turned down. The senior priest was highly influential and dominating. All this had made him sleepless. On examination it was found that he was developing a stye. Considering the Anger with vexation and suppressed anger. Ailments from wounded honour I selected **Staphysagria 1M**, 1 single dose.

Follow up after 4 days- After the medicine he felt that obstruction feeling like while blinking his eyes had disappeared. No sand like feeling. He could sleep better and felt a lot of peace within; On the second day he could apply his mind and do much work. He rejoined the same parish and aborted the idea of resignation. He occupied the same spacious room as previously. The cherry on the cake was he received a transfer within a week to another parish which was a huge blessing to his missionary work.

Follow up after 1 month- No recurrence of the complaint. Keeps in good health.

Discussion: Stye is a benign tumour produced in the eyelid a symbolic representation of blocked emotion of anger. A feeling of reserved displeasure producing anger and ultimately tumour.

Conclusion: Stye resolved with staphysagria and prevented him from losing his vocation, once again making him submissive towards his higher calling.

Reference: Keynotes and characteristics of materia medica by H.C Allen 2th edition published by Indian books & periodicals Publishers.

Case 4 of obsessive-compulsive disorder

Abstract: Acne in adolescence coupled up with O.C.D and effiminate features with concentration problems.

Keywords: Masturbation----O.C.D----Suicidal disposition

Introduction: This case is about the evolutionary journey of a disease in a boy who was ambitious but under influence of strong syphilitic miasmatic forces culminated into crash at academics and finally ending into suicide at a tender age.

On 6th February 2018 A 17 year old boy presented with complaints of pimples on face which leave bad scars. This problem began when he was in class eight (13 years). He went to a dermatologist and took treatment. 6 months later developed washing mania. Was referred to a psychiatrist and after 6 months of her treatment improved. He had a voice and body language which was feminine. On account of this his friends in higher secondary school made mockery of him. His second problem was excessive sleeping and weakness. He was also so lazy that he didn't even pick up his used underwear; his mother would wash it for him. Since he was the only child he was also pampered a lot. He seemed obese and all the time he was hooked to the internet and so addicted to it that his parents had to remind him to pass his stools. Spent sleepless nights watching pornography and masturbated everyday 3-4 times. He was brought up in a religious was so there was tremendous guilt within him. He could not bear criticism. He would demand for new clothes every weekend and harass the parents if demands were not complied to. He would throw water on the mother, point the knife to the father and beat him up also in order to get a new bike. The he would bunk college which created a bad image of him in college. He failed his class eleventh exam and Initially he had joined higher secondary in the science stream as it was prestigious thing to do before his friends and society soon it was realized that he couldn't cope. His father pleaded to the principal and changed his stream to arts. Yet he failed due to bad company of friends. He was highly ambitious. He aspired to be a great historian and do PhD in history and also to meet the queen of England. He felt hopeless since his father could not afford this much and insisted on sending the father abroad in order to earn money like other people's parents were doing. He liked everything Royal, antique things, special violin, also he liked a girl who was from a high caste. But it was a secret love, he was too shy to express and feared being rejected. His other important fear was his image being spoilt hence he was very choosy of his company and only wanted to deal with high class people except his higher secondary friends. He would lie to his father that he is going to college and enjoy rides with his friends. Every day he would

find a new fault and quarrel with his parents. There was history of mental illness on his mother's side and this child was born after several years when the mother was nearing fourty. He was obsessed with collecting death certificates of this ancestors and that was his favourite pastime. The officers at the birth and death registry were fed up with his visiting them. His other dream was to be the sultan of Oman just because he was born in Oman. He desired sweets+2 and was chilly, thirstless. Desired cold drinks and had aversion to vegetables. I prescribed him **Staphysagria 10 M**, 1 single dose.

Follow up after 1 month- After Staphysagria he sweated more and old eruptions returned in more intensity. Started completing his work on time (Assignments), He became good to his parents. Allowed his father to use his new bike. In the whole month there was just one quarrel. He was less irritable. He stopped masturbation. Now thinks of friends just as a part of life and focuses on career. Gave up eating non-veg and reduced 2 kgs.. He passed his eleventh class. He was kept on placebo for 6 months. In this period he went with his family to a vacation in Daman and Diu, where they had some ancestral link. Unfortunately, 7 months later he suddenly commited suicide by hanging himself without any provocation. He asked his mother to prepare soup and said that he was going for bath but instead went inside his bedroom and ended his life. The whole village was shocked because outside he had maintained a very good image but his parents suffered immensely from his ill mannered behaviour. The father accepted his death saying that if he had lived then he would have completely diminished their family name and honour. This case demonstrates the syphilitic dimension of Staphysagria.

Discussion: Staphysagria although has syphilitic aspect yet it was unable to halt the miasmatic activity leading into sudden death.

Conclusion:Even constitutional medicine can sometimes fail to yield positive results if the environment(Internal and external) is not condusive towards positivity.

References: Essence of materia medica by George Vitholkas

Case 5 of Asthma

Abstract: This case is of a young boy who suffered from harrassments at his boarding school leading to breathing issues.

Keywords: Harassed----Anger suppressed----Asthma

Introduction: Orphan students are often mistreated by their superiors in boarding schools since there is nobody to stand up for such kids. These conflicts produce breathing problems which can get overlooked by treating physicians.

On 27th January 2020 a 17 year old boy presented with complaints of asthma since last 5 years < in humidity, > outdoors. > sitting, < lying down. He loves football but exertion worsens his asthma then he has to stop running. His asthma is worse at night on going to

sleep. He had an abashed look on his face. On inquiry it was revealed that his asthma issue began 5 years ago when he was put in a boarding school. Since he is dark in skin colour and an orphan boy, the warden of their hostel would punish him without reason. She made him do all the cleaning and threatened to send his home. He came from a broken home. His father deserted them when they were young. His mother served as a maid and hence had to keep him and his other brother in boarding school. His brother is a successful footballer and he isn't. This pains him a lot. He was full of anger for the warden and one day he fired bad words to her. In 2019 he was thrown out of that boarding and now trains at a football club. He had strong fear that his mother will also disown him just as his father did. Considering the suppressed anger with vexation and his wounded honour. I prescribed Staphysagria 10 M, 1 single dose.

Follow up 11th November 2020: All these ten month he was completely fine. Never needed an inhaler. He presented with nose block worse morning and night. Feels better walking in open air. His tongue was mapped. He felt hungry soon after meals. Frightened to seek help. No medicine given. Advised steam inhalation, warm drinks and cover himself.

Follow up 9th January 2020: All fine and pursues his football training and I often see him cycling in the evenings.

Discussion: If the emotional cause like the vexation generated at the boarding school was not ciphered then the case would never reach to staphysagria a prescription since this remedy doesn't have much respiratory symptomatology in its proving.

Conclusion: The emotional injury and the pent up anger against the warden produced the obstacle of Asthma which came in way of his career, staphysagria helped to resolve the problem. Although he could not succeed to be a footballer yet he is free from Asthma.

Case 6 of Dysmenorrhoea with hypothyroidism

Abstract:A housewife suffering from anger pangs resulting into deep dissatisfaction in her personal life sought help in my homoeopathic O.P.D for anger management treatment

Keywords: Anger violent----Dysmenorrhoea----Insomnia

Introduction: The lady was divorced once and presented for help in resolving her anger issues associated with dysmenorrhoea and hypothyroidism. She did not want to go through another divorce.

On 27th August 2020 I came across a 44 year old women who presented with complaints of uncontrollable anger which had lead to an divorce in her first marriage. She had a 7 year old son but there were constant fights at home with her second husband who is also a divorcee

and she could not stand him anymore. They were not having any physical relation for a long time. She was weeping while narrating about her discords with her present husband. Whenever they would fight she would contact the NGO and that would infuriate the husband and he would come to beat her. She tried taking video's and in anger slammed her phone to the floor. She had sleeplessness trouble since these thrifts with her husband. He would insult her very badly with bad language and holds grudges for long time. She was a fighter who was seeking for peace and love. She would easily become angry and break things as well as beat her child; thereafter she feels bad and cries thinking what she has done. She suffered from severe dysmenorrhoea at the time of menses. Menses were regular 30 days cycle. She suffered from stitching headaches if she fasted. She spoke hurriedly and confessed that she was impatient. In recent months she had developed hypothyroidism and had undergone an operation for fibroid uterus. Her real problem was her uncontrollable anger when some injustice is done unto her which was responsible for her divorce in first marriage also. She was just 24 years old then and had got married only because he was not asking for dowry at the time of marriage but she realized it later that he was an alcoholic and he used to physically abuse her. Then she went into a fighting mode not knowing when to stop. Now she fears that this second husband will leave her and go. This second husband was not a responsible person.

In her childhood there was lot of tension at home because her father was an alcoholic and used to hit her mother. Her father was not responsible about the family. He had kicked the mother when she was in her mother's womb. She had to be sheltered in an ashram. Here she came to know God.

Thermally: Chilly patient

I consulted Kent's repertory 1) Throws things in anger 2) Ailments from mortification. I prescribed **Staphysagria 1M**, 1 single dose on 27th August 2020.

Staphysagria is an emotional person and dependant type, who is sensitive to rudeness. Suppression of emotions is the central idea. These emotions find an outlet on the physical plane as gripping dysmenorrhoea, stitching headaches, insomnia, hypothyroidism and much later on the emotional plane we find in the proving, very peevish; she wishes to throw from her everything which she takes in her hand. Like so many of us staphysagria is the victim of her expectations and desires, especially revolving around relationships. Staphysagria becomes ill from conflicts around her due to the great indignation about things done by others. They usually present with an anxious expression, disposition can be quarrelsome at times but basically they are shy of opposite sex, moody, depressed and suicidal.

Follow up 1st October 2020 –Anger had reduced despite husband still giving her bad words yet she wants love from her husband as in physical relations.(demanding sex and fixed on that is sycotic element) Now even if husband shouts she remains quiet. She is relieved by

consolation. No headache since the homoeopathic medicine has been started. Menses dysmenorrhea less painful. She weeps when she feels hurt and prays to God to save her marriage. No medicine given.

Follow up 12th February 2021- Her Anger is well controlled. No headaches, Menses is regular. Minimal fights with husband. She decided to give up meat after watching a seminar. Does regular meditation. No medicine was given.

Follow up 2nd April 2021- She reported of getting angered easily and husband raises hand on her. She meditates. She wants her husband to show her love by caressing her. Once again, she was feeling sleepless due to this stress. There was an insulting event that had disturbed her. Her present husband's ex-wife was still in contact with her husband and they celebrated their son's birthday together. She feels hurt because her son and she were not invited for the celebration. She feels that this ex-wife should not any contact with her husband. She said that she would commit suicide if he gave her divorce. (Staphysagria has suicidal thoughts but fear of death which is a tubercular element). Staphysagria 10 M, 1 single dose given.

Discussion: Staphysagria helped to calm down this agitated, impulsive and hurried married lady.

Conclusion: Dysmenorrhoea, Insomniaimproved as well as her second marriage was saved from being ruined with timely use of staphysagria.

References: Kent's Repertory published by Indian books & periodicals publishers.

Case 7 of Insomnia with bleeding per Rectum

Abstract: This case is of an an injured pride which resulted into sleeplessness problems which progressed to bleeding per rectum in event of disappointment in love.

Keywords: Bubbled up---injured pride---high libido

Introduction: Disappointment in love is a common occurrence in life but the way each lover suffers is individual expression depending upon his constitution, miasm and sensitivity.

A 27year old unmarried male presented on 5th of March 2023 with complaints of bleeding after stools (20 to 25drops of bright red blood). No pain whatsoever. No constipation. First time bleeding appeared on 28th February 2023 in form of a streak of blood on the stool, especially towards the end of stool 2 drops of blood were noticed by the patient. On 2nd March 2023 soft stools but 5 drops of blood were passed at end of stool. On 4th March 2023 he was stunned to see 20-25drops of blood at end of stool and stools mixed with blood. Painless stools. He was worried after that and decided to consult me. When I saw him, he appeared upset from the face. When inquired into how it all began, he informed that on 11th February 2023 while playing a friendly football match he fell down and sustained blunt injury to his left knee. Initial swelling of left knee reduced after ice application. After this he

observed a firm mass protruding from lateral aspect of left knee specially when he squats on the Indian toilet. On 14th February 2023 Valentine's Day he met a girl whom he was chatting for last 3 months. She seemed equally promising to him but he maintained some distance from her as he had just met her. Later on, while chatting next 2 nights, she inquired from him 'What do I mean to you?' He knew that another boy was after her so he replied diplomatically saying that you are like a colleague. This offended the girl and she immediately disconnected the phone. She messaged him that I won't sleep all night. When he inquired the reason, she replied "That's none of your business". This shattered him completely. He felt as though someone had sledged his brain with a hammer. He could not stand this insult. It made him furious to see such kind of insensitive reply from a girl whom he loved and cared for. He switched his phone off and diverted his mind so that he might be able to get sleep. Next morning, he found a message from the girl 'Good Bye Forever'. This added more to his misery. Soon he started with a toothache, worse by inhaling cold air into mouth. No caries visible. He felt extremely offended and sad. He was just unable to forget the girl and her insult. From next night onwards he never could sleep soundly. He would be awake till 2-3am and sleepy during day. He used to wake up several times at night to pass urine or simply to check the time or woken by wet dreams. Sleep was unrefreshing and even if he tried to sleep during the day, it could not freshen him up for long. Always yawning. Usually, he hates smoking because the taste of nicotine doesn't go even after brushing several times but on 17 February Evening as he smoked on insistence of a friend, he quite enjoyed it and the taste did not bother him at all. On 20th February 2023 He met his ex-Girlfriend on pretext of some work and started asking her to hug him, but she point blank refused and walked away. He was enraged at her behaviour but never showed it externally. He decided to teach her a lesson later on. On 3rd March 2023 he was accused by his best friend for spoiling the sacred environment of the gathering of people. He once again felt very bad but shut his mouth and walked off quietly. Next day started with indurated fiery red pimple of left cheek and tip of nose. At the end of it all he was feeling that everyone wants to injure him. At work place since his sleep would be incomplete then he would shout it out on others. Picking up quarrels. Refusing to follow orders. Insulting his siblings and mocking his colleagues. However, if his colleagues pointed out his flaws or contradicted him then he could not tolerate it. While travelling he would be very cautious to see if any vehicle might dash his injured knee, although there was no tenderness nor pain in it. He would often keep his hands on his knees as if trying to protect and cover it. He felt his legs were not supporting him well, hence while climbing stairs he would firmly hold on to the railing to make sure that even if he slips, he will latch on to the railing. He said that he was feeling like an old man while walking, like being unsure of his stability. He also got a boil just below his suprasternal notch and pus oozed out of it and it healed leaving a keloid like scar. He could not bear much noise; it would anger him and then he would shout very loud. Later on, he felt guilty for having shouted in anger. His teeth and throat were also sensitive to slightest change in temperature of water

(cold water) and in the mornings he would have a running nose after waking up. Chilly patient, good hunger, can eat more even if has just eaten a meal. He felt lonely and wanted somebody to make love. He enjoyed watching girls pass by on the street (Lustful). He would speak everything in double meaning, but shy at the same time when it comes to practically doing it. When inquired whether he felt anger, insulted or sad? He immediately replied that first he felt insulted and felt that his honour was wounded by both the girls and later on he felt sad thinking repeatedly 'How could they do this to me?'.

I referred Dr R.P Patel's corrected version of Kent's repertory for the following rubrics 1) Effects of honour wounded (Ign, Nux-v, Staph) 2) Lasciviousness

We have a choice between Ignatia & Staphysagria. Oversensitive to rudeness, easily excitable, highly emotional, worse from emotions, image consciousness with vexation and reserved displeasure, insomnia after grief, we find in both. But the expression of toothache as a result of constant grinding of teeth in anger, prominent masseter's and sensitive to cold water and always angry are guiding features of Staphysagria. Boger's synoptic key mentions under staphysagria pains that move into teeth, imagines insults. H.C Allen's keynotes says under Ignatia that it cannot bear tobacco smoking and under Staphysagria we find craving for tobacco. According to Boericke's Materia Medica in Ignatia we find painful haemorrhage after stool and stools are passed with difficulty, that is not the case with our patient. Staphysagria in Boericke cites the symptom; dwells on sexual matters.

Prescription given on 5th March 2023 **Staphysagria 1M**, 1 single dose.

Follow up after 3 days on 8th March 2023: Not a single drop of blood in stool nor a strip of blood over the stool ever since began the homoeopathic medicine. Besides this sleeping very deeply and waking up refreshed every morning. No longer short tempered and in angry mood. Much peace at work place.

Follow up on 15th March 2023: No relapse of sleeplessness nor bleeding during stool. Feels strong in the knees and resumed daily walks. No longer worried of sustaining injury to left knee. On two different occasions was able to bear unwarranted insults from two different colleagues but did not retaliate. Later on one of the colleague apologised to him and made peace, the other colleague he forgave without holding any grudge. Gets acidity if overeats and realises importance of exercise.

Discussion: This is a classic case where in an acute emotional imbalanced response(Anger=hate) was triggered in an individual in response to things done by others. The problem arose in the mind but the body is expressing the same pattern freely. Somatization occurs in staphysagria as a result of suppression of emotions & hidden anger especially revolving around relationships. Staphysagria has pronounced action on Nervous system with great sensitiveness to least impression, either mental or physical. Hering calls this as Morbid sensitivity as he is fixed on insults (Sycotic). Least word seems wrong, hurts

him very much, special senses become irritable, cannot tolerate noise, everything is painfully sensate.

Conclusion: Staphysagria helped to reduce his morbid sensitivity bringing back his sleep and peace of mind.

References: Repertory of the homoeopathic materia medica by Dr J.T Kent sixth American edition corrected, revised and improved by Dr Ramanlal P. Patel published by Dr R.P Patel's institute of homoeopathy, Vadodara, Gujarat.

Staphysagria- Background and Uses

Teste remarks that Staphysagria seeds were used in some countries for stupefying and catching fish causing numbness. This pungent plant was used earlier against lice. Therefore the name lice grains or lice pepper is not surprising but rather speaks of a psoric constitution favouring pests. . This plant appears erect and stately against a fence as well as modest and delicate in the bed of other flowers. Horticulturist highly recommend it for cultivation at the fence as it is extremely noticeable, towering above the surrounding plants. Rightly are they called "the garden Aristocrats". This majesty beauty of the plant is found in the patients also. The Staphysagria persons are elegant, often haughty, with a delicate sensitivity and are too dignified to show their true feelings, thereby suffering from reserved displeasure.

Staphysagria has a wide spectrum of usage both in chronic as well as acute cases. It is a valuable remedy for injuries, for example in cuts, lacerated tissue, perineum and very useful in stitching pains remaining in operative wounds after abdominal surgery. Staphysagria has a pronounced effect on the nervous system, with great sensitiveness to the least impression, either mental or physical, as is observed in cases as well. Hering says 'Morbidly sensitive, the least word seems wrong, hurts her very much; special senses become irritable, cannot tolerate; touch, odour, noise, and taste, everything is painfully sensate. Clarke says it produces long lasting vertigo, accompanied by continued nausea as in seasickness.

Staphysagria also affects the eyes; it has a great reputation for recurrent styes that leave indurations and for scurfy margins to the lids. Hering says it is useful in styes, nodosities, chalazae on eyelids, one after another sometimes ulcerating. It is useful in a stye which does not suppurate and break, but remains as a hard nodule. T.F Allen mentions that 'it is extremely valuable for the cure of tumours of the lids; chalazion; staetoma. Scrofulous opthalmia, styes in lids, edges inflamed and hard'. Thus the basic process of inflammation is followed by induration, indicates the sycotic miasm of the drug. Its action in case of post traumatic urethritis with recurrent urinary infections accompanied by constant urge to urinate has been really astonishing and eventually goes into sycotic or tubercular phase. Severe burning of urethra even when not urinating is a peculiar symptom of staphysagria(Nash). In women, coition is painful because the external parts are excessively sensitive. This property makes it a remedy of extreme value to women in the early days of

married life. They have fear of indulging in sex, they may have vaginismus in consequence with painful sex. After happening once, at a certain point in sex after foreplay they freak out, they lock up and cannot proceed because of fear. Staphysagria when taken increases the confidence level.

It is also one of the best for affections of the prostate gland in old men especially with piles, with frequent urination and dribbling of urine afterwards. One of the characteristic symptom mentioned by T.F Allen is "thin stool passes unconsciously, with sensation as if flatus would pass; several thin stools". The seeds are known to produce vomiting and salivation, and is a remedy for toothache; there are caries in which teeth crumble and grow black & brittle. Teeth which have been long decayed rapidly becomes hollow. This speaks of the syphilitic tendency. It is also of great value for bone troubles, exotoses and inflammation of the periosteum, helpful in chronic gout with nodosities. Staphysagria shows a strong reaction on the skin, and is indicated in skin diseases. They tend to develop scalp eczemas, eruptions due to fungus on the scalp (tinea capitis) right from birth. These eruptions can look very similar to Mercurius: With thick crusts and a lot of pus beneath. If you press these crusts with the hand, thick yellow pus will come out. If you remove the crusts raw skin appears. The scalp eczema stinks, burns and itches. The eczema extends on the scalp, face and ears. Symptoms are worse after washing. Not only eruptions on the head, but also other humid eruptions have a bad smell. Even the sweat smells foul.

Staphysagria is most used for eczemas and fungus in testicles and around the groin. The skin is scaly, fired, shows thick crusts and bleeds. The underwear is always blood smeared. The itching changes location when scratched. Staphysagria has crawling not only on the skin but also in other places of the body like hands and feet. Crawling gets along the whole image of this remedy. Staphysagria shows in most cases an extraordinary preoccupation with sexuality. Staphysagria displays already even in small children a higher interest in sexuality than normal. Entering school is a difficult phase. They don't want to go to school because of lack of interest in learning. They day dream and forget what he has read. They have separation fears from home (homesick). Make trouble by painting breasts and genitals on the walls of public toilets. They are afraid of being sent to a boarding school.

In puberty it becomes stronger however he withdraws, surfs lewd sites on the internet, purchases pornographic magazines. But he is too shy to come in contact with the opposite sex. His thoughts and dreams are not aimed at his career but mainly occupied with sexuality and tends to indulge in too much masturbation. He spends too much time in his room, will not take part in family life, refuses to talk about his behavior, and reacts mysteriously and aggressively if talked of. He is ashamed and has feelings of guilt and thinks he has done something bad. If he grows up in a surrounding where sex is considered taboo and is scolded when found flirting with a girl or when she told her parents that her interest in sexuality was abnormal, then they feel restricted to live up to their sexuality. The inner anger increases

and masturbation as well. Staphysagria is very prone to addiction, as adolescents they are likely to be "drop outs" due to memory loss in consequence to his habits and his inner anger also comes up, when he consumes tobacco, drugs or alcohol. This fixation and obsession about sexuality is found in both sexes. The display of sycosis is accompanied with loathing of life.

Appearance

General appearance marked by extreme nervous excitement; face wears an anxious expression; shuffling gait, hands tremble, cannot retain anything in their grasp, not even long enough to drink water without spilling it. Suited to patients who are pale, sunken with blue rings around them, worn out and exhausted as a result of sexual excesses and specially self abuse, hands. Nose is picked and pointed. The face looks younger than its years, with smooth skin and very fine wrinkles and a characteristic radiation of fine wrinkles from the corners of the eyes. Gums pale, spongy, bleeding when touched. Salivation. Canine hunger even when stomach is full. Sleepy all day; lies awake all night; body aches all over. Violent yawning and stretching, bringing tears to the eyes. Great tenderness and weakness all through the body. Desire for stimulants. Craving for tobacco, wine and brandy and begin smoking right from the age of seven. They are tall, and extremely thin, with bony angular faces, characteristic stoop of the shoulders and sharp bony noses. When walking they often keep both arms stiffly by their side, which looks very incongruous, since his gait is usually a languid lope. This 'Washed out' effect version of Staphysagria is generally a combination of sweet, wild and subdues types psychologically. While talking she swallows continually. Serious, silent, occupied with himself, he speaks but little. Phlegmatic, prostrated in mind and sad, but not weeping. Indisposed to serious work. Disposition can be quarrelsome at times. Basically they are shy of the opposite sex, moody depressed, prefers solitude with disposition to suicide. Scrofulous and gouty diathesis.

Mind

Staphysagria is sensitive to rudeness, emotional, shy and introverted. He is afraid of losing the control since they feel sexually excited easily. Suppression of emotions and hidden anger is the central idea. Like so many of us, staphysagria is the victim of her expectations and desires, especially those revolving around relationships. In the female, complaints are often due to enforced continence during absence of husband or from widowhood and staphysgria has been called as the WIDOW'S REMEDY. They feel easily insulted but seldom show their anger. Confrontation is too painful, and it hurts her pride, rather than openly expressing her anger as does Nux-Vomica she will resort to resignation and submissiveness because her indignation finds no natural outlet, Hence the fury is seen by way of enormous eruptions. She is too dignified to fight (delusions: of humility of others while she is great; suffering from pride, envy or chagrin) Once in a way he gets rough, shouts and scolds. Especially if he is married to a dominating woman. He defends himself seldom and mostly swallows his anger.

Staphysagria becomes ill from the conflicts around her (great indignation about things done by others or by himself; grieves about consequences). They are aggravated by mental exertion. He remains silent because he is afraid that his wife could leave him. After receiving Staphysagria they become daring to speak their opinion. Hahnemann in chronic diseases Volume I, p 120 explains that during the treatment of such a suppressed psychological state, a case of long-term suppression, possibly a situation requiring staphysagria, judicious adjustments of the dose(split method), might bring up well-hidden feelings of anger and sadness very rapidly, and the patient may claim to be "very sensitive" to anything in the environment: smells, toxic substances, etc. It is as if the reawakening of the senses that now have difficulty coping with the challenge. This reawakening of senses is following the direction of cure according to Hering. And we also see progression from numbness/paralysis, which is syphilitic by nature, to hypersensitivity, a psoric condition.

Trigger factors- ailments from denial of deserving position, grief, from disappointed love, from anger, from masturbation and from rudeness. A negative delusion gets created through horrific event like that of a patient who was raped as a child by her father. It is clear that they cannot come to terms with this incident and the shame it brought on her. These staphysagria emotions, if kept suppressed, must find an outlet on the physical plane as is evidenced in griping, twisting pain in abdomen, colic attacks after indignation, needle-like stitches in the extremities, especially in the muscles, headaches, chronic cough only in daytime, insomnia after grief, speechlessness, trembling, loss of hair, and much later on the emotional plane as we find in proving, throwing things at the person who offend. Also the delusion of grandeur generated by recurrent failures in finding the ideal partner, one she believes to be her sexual and spiritual equal.

Here we need to differentiate Natrum Mur from Staphysagria. Both have strict upbringing, a lot of arguments in the family, worse consolation and contradiction, insult, silent grief, dissatisfied, introverted, resentful, fear of losing and feel unwanted. Staphysagria has addictive behaviour which Natrum doesn't have. Staphysagria is chilly and thirstless whereas Natrum is hot and thirsty. Staphysagria is afraid of being left alone, about future, fears that something bad could happen, fear of his own shadow whereas Natrum Mur has fear of robbers. Both express angers differently; Staph can be either very abusive and threatening to kill not only themselves but also other close ones, wants to set things on fire or else he will remain silent due to exercising excessive controls. Staphysagria is more dependent type and thinks his wife will run away from him whereas in Natrum mur; who when so deeply hurt, will completely cut off his relationship silently "abaissement", withdraws into the room for every little thing and will brood on the sorrow and will have an inner ability to stand independently. The will, though governed by emotions, is strong and gives it a fair amount of rigidity and sustenance. Do not believe that Natrum mur is better than staphysagria in this respect because Natrum mur is more malicious with anger than

staphsagria. Staphysagria dislikes meditation whereas Natrum Mur becoming addicted to recalling disagreeable memories of the past and for the purpose of thinking of them and indulging in the grief it causes (rumination which is difficult to shake). One can call this "the cultivation of depression". Staphysagria has dry warts cauliflower like sycotic excrescenes behind the glans penis and glandular vegetations of vagina. Whereas Natrum mur has warts on palms of hands.

Staphysagria is a contradictory remedy as Ignatia. It is having annoyance like Colocynthis especially since both are very justice conscious (also Caust) and it is sensitive like Natrum mur.

Complementary remedies: Colocynthis and Causticum.

Antidote: Camphora

Miasmatic classification

Staphysagria is mainly PsoroSycoSphiliticTubercular. The following is a selection of staphysagria symptoms with its miasmatic classification.

Psoric

Sensitive and easily insulted

Post operative colics <eating and drinking

>Warm

Guilty after shouting in anger

High libido

Always yawning which relieves

Lot of appetite

Fear of losing something

Ailments from wounded honour and injured pride

Burning, Stinging pain <touch

Guilty feeling after masturbation

Sycotic

Demanding for sex and fixed on that

Suppressed anger

Guilt feeling and hangs in a state of shamelessness

Fixed on insults

Introvert

Breath and gums malodourous

Syphilitic

Addiction begins early in childhood

Abusive, calling bad names, throwing things, strongly enraged

Cadevorous sweat

Hopeless

Teeth already black and broken

Tubercular

Always swallows during speaking

Moody

Cracking the fingers

Demands sex although it doesn't do good

Strong appetite in spite of full stomach

Tired during day and wakeful during night

Strong night sweat

Empty feeling in stomach which doesn't get better after eating

Suicidal thoughts but fear of death

Approach Of Homoeopathic Medicine In Acute Abdominal Pain

Dr. Santosh kumar Jha, Professor & HOD, Department of Gynaecology & Obstetrics, Aarihant Homoeopathic medical College & RI, Bhoyan Rathod, Gandhinagar, Gujarat.

Dr. Maheshkumar A. Gite, Professor, Department of Repertory, Aarihant Homoeopathic medical College & RI, Bhoyan Rathod, Gandhinagar, Gujarat.

Dr. Riddhi J Makwana, Assistant Professor, Department of Gynaecology & Obstetrics, Aarihant Homoeopathic medical College & RI, Bhoyan Rathod, Gandhinagar, Gujarat.

What do you mean by the term Acute Abdominal Pain? A Lot of people get confused between a stomach pain which could be due to some gastric issues and the term acute abdominal pain. Acute abdomen refers to a sudden, severe abdominal pain and requires immediate diagnosis and cure. It is such a condition in which quick attention and treatment is needful. Abdominal pain is common and often miner. Abdominal pain is pain that occurs between the chest and pelvic regions.

Abdominal pain can be crampy, achy, dull and sharp or intermittent. Its also called a stomachache. Major organs located in the abdomen includes intestine, kidneys, appendix, spleen, stomach, gall bladder, liver and pancreas. Viral, bacterial or parasites infection that affects the stomach and intestine, may also cause significant abdominal pain. This type of pain can be described as localized, cramp like or colicky.

Localized pain is limited to one area of the abdomen. This type of pain is often caused by problem in a particular region. The most common cause of localized pain is stomach aches. Cramp like pain may be associated with diarrhea, constipation and bloating. In women, it can be associated with menstruation, miscarriage or complication in the female reproductive organ. This pain comes and goes and may completely subsides on its own without treatment.

Colicky pain is a symptom of more severe condition such as kidney stone. This pain across suddenly and make feel like as severe muscle spasms. Older adults and those who have HIV infection or who are taking immune suppressant may have less abdominal pain than younger or healthy adult with a similar disorder, and if the condition is severe, the pain may develop more gradually. Approximately 50% cases are admitted to general surgical unit urgently.

Abdominal pain has a large number of possible causes and so therefore a structured approach is compulsory. The treatment of pain is a collaborative effort. Causes can be divided in to six large categories including inflammatory, mechanical, nephrotic, vascular, congenital and traumatic. Who are in unstable condition have severe abdominal pain with concerning and abnormal vital sign such as fever, low blood pressure, increased heart beat and loss of consciousness.

Homoeopathic medicines are prescribed on the basis of individualization and symptom similarity by using holistic approach. On the basis of cause, sensation and modalities of the complains the appropriate medication is provided.

• Aconitum napellus: Hot, tense, enteritis. Sensitive to touch. Colic, no position relieves. Pains are intolerable, they drive him crazy; restless; at night. Abdominal symptoms are better after warm soup. Burning in the umbilical region.

• Aloe socotrina: Pulsating pain around navel, worse pressure. Cutting, gripping pain under the right ribs or in the right hypochondrium, right lower portion of the abdomen; excruciating before and during stool; all pain ceases after stool, leaving profuse sweating and extreme weakness; copious flatus.

• Belladonna: Distended, hot. Transverse colon protrudes like a pad. Tender, swollen. Pain as if clutched by a hand; worse jar, pressure. Cutting pain across; stitches on the left side of abdomen, when coughing, sneezing or touching it. Extreme sensitiveness to touch.

• Mag phos: Enteralgia, relived by pressure. Flatulent colic, forcing the patient to bend double; relieved by rubbing, warmth, pressure; accompanied with belching of gas, which gives no relief. Bloated abdomen, must loosen clothing, walk about and constantly pass flatus.

• Nux vomica: Flatulent distention with spasmodic colic. Colic from uncovering. Liver engorged, with stitches and soreness. Colic with upward pressure, causing short breath. Strangulated hernia.

• Plumbum metallicum: Excessive colic, radiating to all parts of body. Abdominal wall feels drawn by a string to the spine. Intussusceptions; strangulated hernia. Abdomen retracted, obstructed flatus with intense colic. Colic alternates with delirium and pain in atrophic limbs.

Polygonum punctatum: Griping pain, with great rumbling, nausea and liquid faeces. Flatulent colic.

• Dioscorea villlosa: Feeble digestive powers. Violent twisting colic, in paroxysms, as if intestines were grasped by powerful hand. Colic pains <from bending forward and while lying >on standing erect or bending backwards.

• Dulcamara: Colic from cold. Acts prominently on umbilical region. Cutting pain around the navel. Swelling of the inguinal gland.

Chamomilla: Flatulent colic, after anger with red cheeks and hot perspiration. Hepatic colic, acute duodenitis.

• Colchicum autumnale: Ascites. Borborygmi. Pain over liver region. Caecum and ascending colon distended. Autumnal dysentery; white mucus

Lycopodium: Hepatitis, atrophic form nutmeg liver. Pain shooting across the lower abdomen, from right to left. Abdomen bloated, constant sense of fermanetation, like yeast.

Mag phos: Enteralgia, relived by pressure. Flatulent colic, forcing the patient to bend double; relieved by rubbing, warmth, pressure; accompanied with belching of gas, which gives no relief. Bloated abdomen, must loosen clothing, walk about and constantly pass flatus.

"TO STUDY THE IMPORTANCE OF CAUSATION IN HOMOEOPATHIC PRESRIPTION WITH SPECIAL EMPHASIS ON PLANT KINGDOM."

Dr.Vineeta Neeraj Kumar[1]
Assistant Professor, Department of Surgery, Aarihant Homoeopathic Medical College & Research Institute, Swarnim Startup And Innovation University, Bhoyan Rathod , Near ONGC WSS, Adalaj Kalol Highway, Gandhinagar, Gujarat-382420

Dr.Syeda Massarat Sultana[2]
Professor, Department of Forensic Medicine & Toxicology, Aarihant Homoeopathic Medical College & Research Institute, Swarnim Startup And Innovation University, Bhoyan Rathod, Near ONGC WSS, Adalaj Kalol Highway, Gandhinagar, Gujarat-382420

Abstract:
Homoeopathy gives great importance to causation. Causation is one of the elements of symptoms, which when strong and genuine, is of much benefit in the remedial diagnosis, and so far we have come across several successful cures made by remedies selected on this basis.

In the field of medicine, the word "Cause" has been used since ages. Physicians knew that there can not be diseases without a cause. Homoeopathy goes further and propagates that there is a cause in the dynamic level that comes to activity much before the invasion of microbes. This dynamic cause should be removed to cure a patient. As per the concept of homoeopathy, the cause behind every disease is derangement of the vital force by the dynamic noxious influences called miasms. This is the real cause that flows in to effect in the form of sickness. Hence, tolle causam can be related with both orthodox medicine and homoeopathy, but for the former it is about removing the material cause and for the latter it is the removal of a dynamic cause.

Another expression of cause in homoeopathy is causation, which are the factors responsible for a symptom produced in an individual patient. We know that causation, location, sensation, modalities, and concomitants are the components of a symptom. It is not mandatory to have all these components in a given symptom. The causations and modalities mentioned in the materia medica and also in the repertories are the exciting causes that can result in the production of symptoms in a sensitive or susceptible individual. Our body is sensitive to the external world and reacts to any stimuli on the basis of individual sensitivity and susceptibility developed as a result of the miasmatic background. Some external influences can activate the latent psora and the signs and symptoms are manifested externally. Here, the indicated medicine similar to the signs and symptoms of the patient can be given to achieve a cure.

KEYWORDS
Homoeopathy, causations, symptoms, complementary medicines, alternative medicines, constitutional

Medicines and there causes:

Abies Nigra:

It is useful in indigestion in those persons, who abuse tea drinking, tobacco Smoking or tobacco chewing.

Actea Spicata:

Aliments from change from change of weather and temperature, slight exertion worse from cold air, night, touch, and from fatigue and mental exertion.

Abrotanum:

Rheumatism from suddenly checked diarrhea or other secretion

Aconitum Napellus:

Complaints from exposure to dry cold air, dry north or west winds, getting Chilled, when perspiring, Suppressed sweat, from fright specially amenorrhea,
Anger, shock, etc. Cough from dry cold wind and draught of air.

Actea Racemosa:

Aliments from mental strain, anxiety, fright, disappointed love, exertion and child bearing, mania and from disappearance of neuralgia. Menses delayed or suppressed by mental emotion, from cold or from fever. Rheumatism from using arm in sewing, typewriting, piano playing

Aethusa Cynapium:

Complaints during dentition or hot summer weather, after milk, mental retardation

Agaricus Muscarius:

Blood poisoning fright, frostbite, mental exertion or excitement overexertion Alcoholism and sexual excess.Chilblain after exposure to cold, epilepsy from suppressed eruptions.

Agnus Castus:

Bad effect of suppressed gonorrhoea, complaints from onanism

Allium Cepa:

Catarrhal discharge from north –eastern winds, getting wet.Colic from by getting feet wet, over exertion from cucumber, and salads.Neuralgia of stump after amputation, phlebitis after forceps delivery

Aloe Socotrina:

Aliments dye to fast food and packed food.Constipation from artificial food bottled food and pregnancy. Sedentary habits and poor diet.

Apocynum cannabium:

Dropsy after typhus, typhoid, scarlatina or cirrhosis after abuse of quinine, Cough during pregnancy.

Arnica Montana:

Bad effect of mechanical injury, over exertion, retention or incontinence of Urine after labour. Aliments from spiritual liquors or charcoal vapours.

Abies Canadensis:

Uterine displacement due to defective nutrition and debility. Aliments due to excessive loading of stomach

Abroma Agusta:

White ulcer at mouth of prepuce caused by excessive passage of sugar in the urine. Weakness of heart worse on movement. Aliments of skin, in summer.

Actea Spicata:

Aliments from change of Weather. Complaints after slight exertion. Hypersensitive to cold. Joints swell,cannot touch or move.Tingling sensation specially in old age.

Aesculus Hippocastanum:

Aliments in morning and after stool. Complaints on walking ,lying, and stooping. Aliments after passing urine.

Ailanthus Glandulosa:

Worse after suppressions.Faint on rising up, or vertigo aggravated after lying down.
Aliments after sight of food.

Allium Sativum:

Least change in diet causes trouble.Aliments due to cold air and during menses.

Alstonia scholaris:

Complaints after exhausting diseases. Diarrhea immediately after eating

Anacadrium orientale:

Complaints worse after mental exertion. Aliments due to emotions like, anger, fright, care etc. Stepping hard, Motion.Aliments from draft, open air, cold etc. Dyspepsia long after eating.

Andrographis paniculata:

Worse during fever. Fever comes at 11am and then again at 7-8 pm. Aliments due to worms.

Artermisia vugaris:

Epilepsy after fright and other violent emotions; after masturbation. Aliments during menses

Arum Triphyllum:

Headache from too warm clothing. Worse due to overuse of voice. Aliments from talking and singing.

Asafoetida:

Worse at night ,during rest, from warm application. Suppressed skin symptoms produce nervous disorder. Orbital neuralgia worse at night. Bad effects of Mercury

Asarum europaeum:

Nausea worse after eatinngEyes feel stiff, burn worse in sunlight. Aliments in dry cold weather and emotion

Avena sativa:

Aliments due to defective nutrition. Morphine causes nervous exhaustion. Post diphtheritic paralysis.

Belladonna:

Aliments from draft of cold air and haircut. Convulsion during dentition. Sunstroke

Berberis vulgaris:

Rheumatic and gouty complaint due to disease of urinary organs.Chest complaints and cough after operation for fistula.Aliments from jarring, stepping hard, rising from sitting , fatigue ,urinating, twilight.

Bryonia alba:

Aliments from chagrin, mortification and anger.Complaints when warm weather sets in after cold days, from cold drinks and ice in hot weather. After taking cold or getting hot in summer, from chilling when overheated and from exposure to draft of cold wind.Aliments from suppressed discharges, menses, milk or eruption of acute exanthema. Diarrhoea during spell of hot weather, from cold drinks when over heated and from fruit or sauerkraut.

Bellis Perennis:

Ill effect of cold drinks, when overheated. Affections due to cold wind, blows, fall, Injury, accidents, childbirth.Exposure to wet or getting chilled when overheated. Overwork, overexertion,surgical operation.

Bovista:

Aliments due to inhalation of charcoal fumes. Worse from menses, hot weather.

Aliments from getting warm, cold food, wine, coffee, and full moon .Easily intoxicated.

Baptisia tinctoria:

Fever with chill around 11am. Worse humid, heat, fog, indoor.Dyspnoea from weakness in chest.

Capsicum annum:

Worse uncovering, open air, cold water and slight drafts. Shivering after drinking. Burning constriction worse between acts of deglutination.Bursting headache worse coughing.

Cardus marinus:

Worse lying on left sideProfuse diarrhea due to rectal cancer Aliments from beer, eating, touch and motion.

Caulophyllum thalictroides:

Aliments during pregnancy.Aliments due to suppressed menses. Complaints worse in open air.

Ceonathus americanus:

Aliments due to cold weather.Unable to lie on left side.

Cicuta virosa:

Aliment after injury to brain.Aliments due to jar, noise and touch. Jerking tearing in coccyx, especially during menses. Worse during dentition and after suppressed eruption.

Conium maculatum:

Aliment after seeing moving objects.Aliments after exertion, rising arms, injury and sexual excess.Worse lying down, turning or rising in bed.

Convallaria majalis:

Worse in warm room.Palpitation from least exertion. Aliments due to heart diseases.

Crocus sativa:

Worse, lying down, hot weather, warm room. Aliments in morning, before breakfast.
Aliments during puberty and pregnancy.

Croton tiglium:

Worse least food or drink.Cough as soon as he touches the pillow, must get up.
Aliments after washing and during summer weather.

Cactus Grandiflorus:

Aliments from climacteric, headache and neuralgia. Ill effects of sun, dampness, disappointment in love, grief.

Calendula officinalis:

Traumatic affectionsPost - operative complaints. Traumatic neuroma. Neuritis from lacerated wounds.

Cannabis sativa:

Aliments from exercise, exertion, talking, walking, lying down, going upstairs. Aggravated by touch, open air heat.Worse at night after midnight and after a meal, from coffee, liquor, tobacco.

Caulophyllum thalictroides:

Aliments during pregnancy, parturition and lactation. Haemorrhage after hasty labour. Haemorrhage after want of tonicity. Haemorrhage after abortion. Uterine debility causes habitual abortion.

Chamomilla:

Complaints from anger, especially chill and fever. Toothache from coffee, during menses or pregnancy.Diarrhoea from cold, diarrhoea from anger.Diarrhoea from chagrin. Diarrhoea during dentition. Diarrhoea sfrom abuse of tobacco. Convulsion of children from feeding by mother after a fit of anger. Ailments from abuse of opium or morphine.

Chelidonium majus:

Ailments due to change of weather. Ailments from liver or lung disease.Malignant ulcers.
Convulsions due to worms, during dentition and during puerperium.Chronic effects from concusion of brain and spine. Tetanus from getting splinters into flesh. Ailments from suppression of eruptions, brain diseases.

Cina:

Ailments due to worms, especially ascarides. Bad effects of pertussius.Complaints after exposure to cold.

Cinchona officinalis:

Broken down from exhausting diseases.Ailments from loss of vital fluids such as haemorrhage, excessive lactation, diarrhoea, suppuration etc. Ailments from malaria. Dropsy after acute diseases.Headache after sexual excess or haemorrhage.Bad effects after abuse of tea or chamomilla tea.

Coca:

Ailments from mental and physical strain of a busy life. Bad effects of mountain climbing or ballooning. Bad effect due to abuse of stimulants, alcohol and tobacco.

Cocculus indicus:

Ailments from riding in a carriage, boat, rail or car. Ailments of drunkards.Bad effects of loss of sleep. Bad effects from mental excitement, night watching, anger and grief.

Coffea cruda:

Ailments from sudden emotion and pleasurable surprises. Ailments from weeping.

Colchicum autumnale:

Ailments from grief and misdeeds of others. Bad effects of night watching. Complains from smell of cooking food.

Collinsonia canadensis:

Haemorrhoids in later months of pregnancy.

Colocynthis:

Ailments from chagrin, anger with indignation. Complaints after diarrhoea and suppression of menses.

Cyclamen europoeum:

Ailments from suppressed grief. Ailments from terrors of conscience. Ailments from duty not done.Ailments from bad act committed.

Digitalis purpurea:

Complaints due to menopause.After effects of scarlet fever—dropsy.

Dioscorea vilosa:

Bad effects from abuse of tea, especially flatulence.

Drosera ratundifolia:

Cough after measles. Laryngeal phthisis after whooping cough.

Dulcamara:

Catarrhal rheumatism or skin affections due to exposure to cold, damp rainy Weather. Ailments from sudden change in hot wather. Anasarca after malaria, rheumatism or scarlet fever.

Dropsy after suppressed sweat or eruptions or exposure cold.Diarrhoea from change of warm to cold weather.

Bad effects of abuse of mercury.

Echinacea augustifolia:

Aliments after operation and injury.

Equisetum hyemale:

Worse at close of urination.Worse on right side, movement, pressure, touch and sitting down.

Eucalyptus globules:

Aliments due to slow digestion.Worse periodically.

Eupatorium Perfoliatum:

Cough after measles or suppressed intermittents.

Euphrasia officinalis:

Bad effects from fall, contusions or mechanical injuries of external parts.Coryza from warm, south wind.Dropsy after loss of vital fluids.Dropsy after abuse of quinine.Dropsy after suppressed intermittents.

Gymnema sylvestre:

Aliments due to long standing diabetes mellitus.Worse coitus

Geranium maculatum:

Aliments after profuse hemorrhages, pulmonary and from different organs.

Gossypium herbacium:

Nausea with inclination to vomit before breakfast.Worse motion

Gratiola officinalis:

Worse drinking too much water.Vertigo during and after meals.Aliments during summer, motion and after drinking coffee.

Gelsemium sempervirens:

Nervous affections due to onanism in both sexes.Bad effects of fright, fear, exciting news and sudden emotions. Diarrhoea from anticipation. Change of weather.General depression from heat of summer or sun.

Hamamelis Virginia:

Incised, lacerated or contused injuries from fall. Chronic effects of mechanical injuries.Traumatic conjunctivitis.Uterine hemorrhage from riding rough roads. Bad effects from loss of blood.

Helleborus niger:

Melancholy in girls at puberty, after typhoid, when menses fails to return after appearing. Paralysis after meningitis.After effects of scarlet fever or tuberculosis hydrocephalus.

Diarrhea during dentition.

Hydrastis Canadensis:

Bad effects from abuse of alcohol-derangement of gastric and hepatic functions. Bad effects of mercury or potassium chloride.After effects of Syphilis.

Hyoscyamus niger:

Convulsions of children from fright or worm trouble. Convulsions in children after an attack of measles.Bad effects of unfortunate love—often causes epilepsy. Intense sleeplessness of irritable, excitable persons from business embarrassment.Paralysis of bladder after labour.

Hypericum Perforatum:

Bad effects of mechanical injuries of spinal cord, and spinal concussion.Pain after a fall on coccyx.Injuries from needles, splinters and rat bites.Nervous depression due to wounds or surgical operations.Bad effects of shock. Bad effects of fright.Bad effects of mesmerism. Headache after a fall on occiput.Convulsions after blows on head or concussion.

Hydrocotyle asiatica:

Aliments after ulceration of womb.Difficult in maintaining the upright position.

Hyoscyamus niger:

Worse after emotions like fright and jealousy.Worse, at night during menses after eating when lying down.Aliments due to touch and during sleep.

Ignatia amara:

Spasmodic laughter from grief.Bad effects of long continued grief — mental and physical exhaustion.After effects of anger or disappointed Iove.Complaints mainly convulsions in sleep-in children when reprimanded or scolded. III effects from bad news.III effects from vexation with reserved displeasure. III effects from suppressed mental sufferings.III effects of shame and mortification.Bad effects of tobacco and smoking.Constipation from carriage riding or due to habitual coffee drinking.Proplapse ani from over-lifting.

Ipecacuanha:

Nausea from tobacco.Nausea of pregnancy.

Kalmia latifolia:

Aliments from, lying on left side, bending forward and looking down.Worse in sun heat.

Aliments in cold weather

Ledum Palustre:

Abuse of alcohol causing gouty and rheumatic complaints. After effect of iredectomy—haemorrhage into the anterior chamber.Punctured wounds from sharp pointed instruments as awls or nails.Bad effects of rat bites, stings of insects, especially mosquitos. Long remaining discolouration agter injury.

Lobelia Inflata:

Headache with nausea and vomiting and prostration from tobacco.Abuse of tea or tobacco causes faintness, weakness and an indescribable feeling in epigastrium.

Lycopodium clavatum:

Ailments of drunkards. Ailments from anger.Ailments from fright.Ailments from chagrin, mortification.Ailments from vexation with reserved displeasure.Ailments from mental exertion. Ailments from over-lifting. Ailments from over-eating. Ailments from sexual excesses. Ailments from abuse of alcoholic drinks.Ailments from deep-seated progressive chronic diseases.Constipation since puberty.Constipation since last confinement.Constipation when away from home.

Complaints after maltreated pneumonia.Bad effects of onion, bread, wine, tobacco smoking and chewing.

Lathyrus sativus :

Aliments after influenza and exhaustive diseases.Aliments after lathyrus poisoning.

Lilium tigrinum:

Worse due to warmth of room.Aliments after motion, walking and standing.Worse consolation.

Lycopus virginicus:

Aliments due to excitement and exertion.Aliments started after become abuse to heart remedies.Worse after thinking about complaints.Aliments after heat and lying on right side.

Melilotus officinalis:

Worse rainy and changeable weather.Approach of storm Motion and 4 pm

Mezerium:

After effects of vaccination, eczema and itching eruptions. Headache after slight vexation.Headache on slightest touch.Nuralgic pains after zona.Ailments from abuse of mercury—bone affections.

Millefolium:

Ailments from over-lifting, over exertion or a fall. Profuse hemorrhage from wounds, especially after fall. Haemoptysis after injury.Haemoptysis in haemorrhoidal patients.Haemoptysis from rupture of blood vessel.Painless bleeding after miscarriage.

Painless bleeding after great excertion.Painless bleeding after abortion.Cough after suppressed menses.Cough after suppressed haemorrhoids.Cough after a fall from height.

Cough after violent exertion.

Nux Moschata:

Complaints of pregnancy.Diarrhoea in summer.Diarrhoea from cold drinks.Diarrhoea in autumn.Diarrhoea from boiled milk.Diarrhoea during dentition.Diarrhoea during pregnancy.Eating a little too much causes headache, nausea and vomiting from wearing pessaries. Cough from over-heating.

Nux Vomica:

Ailments from want of exercise-sedentary habits. Modern life style.Aliments from taking tobacco, coffee and alcohol.Irregular diet and over-eating. Long continued mental exertion and loss of sleep. Sedentary habit and sexual excess.

Opium:

Ailments from fright.Ailments from charcoal vapors'.Ailments from inhaling gas.Ailments of drunkards.Spasm of children from seeing strangers, from nursing after fright of mother and from crying. Involuntary stool after fright.Involuntary stool from paralysis of sphincter.Retention of urine after labour.Retention of urine from excessive use of tobacco.Retention of urine in nursing children.Persistent diarrhoea after abuse of drugs. Paralysis of brain or convulsion from suppression of acute exanthemata.

Ocimum sanctum:

Aliments after remittent fever.Toothache , worse at night, on touch and from cold.Aliments due to lack of concentration.

Plantago major:

Periodical prosopalgia, worse 7 am to 2 pm.

Podophyllum peltatum:

Ailments from over-lifting or straining-prolapse of uterus.Ailments from prolapse of uterus.Ailments from abuse of mercury.

Phytolacca decandra:

Rheumatism and neuralgia after diphtheria, gonorrhoea, and syphilis and from abuse of mercury.Parotid and submaxillary glands indurated after diphtheria or scarlet fever.

Pulsatilla nigricans:

Ailments from puberty, have never been well since that time Ailments from grief, anger, fright.Ailments from overstudy.Ailments from eating rich food, fat food, cake, pastry, sausage, ice cream etc. Ailments from deranged stomach.Ailments from heat of the sun.

Ailments from loss of vital fluids.Ailments from sexual excesses.Ailments from suppression of menses.Ailments from abuse of tobacco, quinine, iron, mercury, tonics, sulphur etc.Ailments from after measles.Ailments during pregnancy and lactation.Ailments from getting wet.Diarrhoea from fruits, cold food or drinks, ice cream etc. Suppression of menses from getting feet wet.Styes from eating fat, greasy or rich food or pork.

Ratanhia:

Ailments of early months of pregnancy—toothache.

Rananculus Bulbosus:

Bad effects of alcoholic beverages—spasmodic hiccough, delerium tremens.Ailments from sedentary habit.Ailments from needle work, typewriting, piano playing etc.Ailments from atmospheric changes.Ailments from sudden exposure to cold while overheated or mice-versa, pleurisy or pneumonia.Intercostal rheumatism from wet stormy weather.

Intercostal neuralgia after herpis zoaster.

Rheum:

Ailments from dentition.Ailments from abuse of magnesia.

Rhododendron:

Ailments from thunder-storm, especially electrical storm in nervous persons.Toothache in spring.Toothache from change of weather.Toothache from thunder-storm.Toothache from windy weather.Rheumatic pain in limbs from wet, cold, windy weather. Induration and swelling of the testicle after gonorrhoea or rheumatic complaints.

Rhus Toxicodendron:

Ailments from getting wet, especially after being overheated. Ailments from exposure to cold and dampness lying on damp –ground.Ailments from over-exertion.Ailments from trauma.Ailments from spraining or straining a single part, muscle or tendon.Ailments from overlifting, particularly from stretching high up to reach things.Ailments from too much summer bathings in lake or river. Headache from beer, from least chagrin.Paralysis from getting wet on lying on damp ground.Paralysis from overexertion.Paralysis from parturition.Paralysis from sexual excesses.Paralysis after malaria or typhoid.

Rumex Crispus:

Ailments from exposure to cold, mainly hoarseness.

Ruta Graveolens:

Ailments from mechanical injuries of bones and periosteum. Ailments from sprains, fractures and dislocations.Lameness after sprains.Phthisis after mechanical injuries to chest.Aching in and over eyes, blurred vision after using eyes at fine work, watch-making, engraving or looking intently.Amblyopia or Asthenopia from overexertion of eyes, overuse in bad light, fine, sewing and over-reading at night.Constipation from inactivity or impaction following mechanical injuries.

Rhus venenata:

Profuse watery stool at 4 am.Aliments from heat of bed.

Robinia pseudacacia:

Headache due to gastric complaints.Aliments due to hyperchlorhydria.

Salix nigra:

Aliments due to excessive sexual desire.Marked nervous disturbances before and during menses.

Senega:

Worse walking in open air and during rest.Aliments from pressure and touchCough aggravated after lying on right side.

Sabina:

Ailments from abortion or premature labour.Retained placenta from atony of uterus.Menorrhagia during climacteric in women who formerly aborted.Inflammation of ovaries or uterus after abortion or premature labour.

Sabadilla:

Ailments from worms—nervous diseases, twitching,convulsive, tremblings, catalepsy etc.Headache from too much thinking.Headache from too close application or attention.

Headache from worms.

Sambucus Nigra:

Ailments from violent mental emotions, anxiety or grief.Ailments from excessive sexual indulgence.Ailments from abuse of arsenicum.Ailments from fright.

Sanguinaria:

Ailments during menopause—headache, flushes of heat, leucorrhoea, burning of palms and soles etc.

Secale Cornutum:

Ailments from lifting—miscarriage.Ailments from injury—gangrene.Ailments from sexual excess.Ailments during pregnancy and after delivery.Ailments during menopause.

Ailments from suppression of menses, lochia, milk or sweet.

Staphisagria:

Mental effects from onanism and sexual excesses.Memory weak, indifferent, apathetic from sexual abuse. Ailments from fright, envy or chagrin. Indignation.Trembling and exhaustion and getting sick from being insulted.Effects of mechanical injuries from sharp cutting instruments and surgical operations. Colic after lithotomy or cophrectomy.Frequent urination after difficult coition and labour.Cough after tobacco smoke.Fig warts after abuse of mercury.

Stramonium:

Mental symptoms, especially loquaeiouseness from suppressed menses.pupils dialate when child reprimanded.Vontiting from seeing a bright light.Convulsions from sight or bright light, mirror or water.Metrordagia and delirium from retail placenta.
Fear and fright from darkness.

Symphytum:

Ailments from mechanical injuries, blows, bruises, thrusts on the globe of the eye. Pain in eye after blow of an obtuse body, snow-ball strikes eye, infant thrusts its fist into the mother's eye.Pinching pain and soreness of periosteum after an injury. Bad effects from abuse of arsenic and many modern drugs.

Tabacum:

Ailments from cerebral irritation.Amaurosis from atrophy of retina or optic nerve.Ailments from travelling in ship-deathly nausea, pallor, coldness etc.Diarrhoea from excessive smoking.Palpitation from lying on left side.Ailments from abuse of tobacco.

Thuja Occidentalis:

Ailments from badly treated or suppressed gonorrhea. Ailments from abuse of tea, coffee, fats, tobacco, onions, sweets, sulphur and mercury. Ailments from vaccination.
Ailments from walking or riding. Headache from sexual excesses, over-heating and from tea.

Terminalia arjuna:

Aliments after heart disease both organic and functional.

Urtica urens:

Worse from cool moist air and bathing. Aliments from snow air and touch.

Veratrum album:

Cholera after fright. Aliments during pregnancy. Diarrhea with cramps and prostration after fright. Ailments from abuse of opium, alcohol and tobacco.
Pain in limbs in wet weather.

Veratrum Viride:

Headache, nausea and vomiting from suppressed menses. Ailments from exposure to sun heat, especially sunstroke.

Valeriana officinalis:

Aliments due to hysteria and over sensitiveness.Otalgia from exposure to draught and cold

Verbascum Thapsus:

Aliment from change of temperature. Aliment from talking sneezing and biting hard.
Worse at 9 am to 4 pm.

Viburnum opulus:

Aliments after lying on affected side. Worse in a warm room, evening and night.

Vinca minor:

Weakness due to excessive menstruation.Hemorrhage from fibroids.

Viscum album:

Worse in cold stormy weather. Aliments after movement and lying on left side.
Worse become chill while hot.

Xerophyllum :

Worse, application of cold water. Aliments in afternoon and evening.

INTRODUCTION: -
"Diabetes mellitus is a clinical syndrome characterized by hyperglycemia due to deficiency ordiminished effectiveness of insulin "Efficacy of Constitutional Remedies in Management of DMT2

KEYWORDS
Homoeopathy, Diabetes mellitus, constitution, insulin, diabetes type 2.

CONSTITUTION: -
According to Stuart close: - "Constitution is that aggregate of hereditary characters, influenced more or less by environment, which determines the individual's reaction, successful or unsuccessful, to the stressof environment"
Type of constitutional: -

1. Scrofulous constitution
2. Hydrogenoid constitution
3. Leucophlegmatic constitution

NEED OF STUDY

Diabetes mellitus is a syndrome – ubiquitous and dynamic. WHO predicts that India will have largest number of diabetics, around 80.9 million, by 2030. Research finding in conventional medicine put toward the limitations & side effects of hypoglycemic agents, insulin therapy, zinc, overdose also side effects of sweeteners.

In view of the alarming rise of diabetes, the holistic therapy of homoeopathy is very beneficial for the sake of ailing humanity. Homoeopathic literature is full of information regarding the management of Diabetes. The number of medicines as well as clinical experiences regarding Diabetes Mellitus are increasing day by day hence to accommodate all these growing information a well selected repertory is needed. There are so many repertories available in the field of Homoeopathy and now a days the practitioners are using them in finding out the similimum according to the symptoms presented by the diabetic patients. Still a need is felt among practitioners to find out the more useful repertory in cases of diabetes mellitus to deal with patient's complaints. Among the various repertories, Homeopathic Medical Repertory by Robin Murphy, contains information from all the existing repertories & correction from various sources.

Thus, this repertory must contain all the rubrics related to symptomatic complaints appear in a patient suffering with diabetes mellitus. This work is not intended to be one more addition to the rich and varied homoeopathic literature, but to reiterate the value and importance of Homeopathic Medical Repertory.

AIMS:

- Evaluate the effectiveness of constitutional remedies for treatment of DMT2

OBJECTIVE:

- To understand the role of constitutional remedies in treatment of DM Type 2
- To understand the which potency is more effective in treatment of DM Type 2.
- To prevent the complication and recurrence and provide the cure in rapid and gentle way.

REVIEW OF LITERATURE:

Diabetes Mellitus is probably one of the oldest diseases known to man. It was first reported in Egyptian manuscript about 3000 years ago. In 1936 the distinction between type-1 and type-2 DM was clearly madetype-2 DM was first described as a component of metabolic syndrome in 1988. Type-2 DM is the most common form of DM characterized by hyperglycemia insulin resistance and relative insulin deficiency DMT2 results from interaction between genetic environmental and behavioral risk factor. It is estimated that 366 million people had DM in 2011 by 2030 this would have risen to 552 million the number of people with DMT2 is increasing in every country with 80% of people with DM living in low- and middle-income countries DM caused 4.6 million people would have DMT2 by the year 2030.Literature search has shown that there are few data available on the prevalence of DMT2 in Africa asa whole. The majority of the DM burden in Africa appears to be DMT2, with less than 10% of DM cases being DMT2.In 2011 center for disease control and prevention report estimates that DM affects about 25.8 million people in the US in 2010 with 90 to 95% of them being DMT2.As a result of this trend, it is fast becoming an epidemic in some countries of the world with the number of people affected expected to double in the next decade due to increase in ageing population thereby adding to the already existing burden for healthcare providers, especially in poorly developed countries. This review is based on a search of midline, the Cochrane database of systemic reviews, and citation lists of relevant publication. Type 2 diabetes occur mostly in people aged over 40years. However, an increasing number of younger people, even children, are being diagnosed with type 2 diabetes. The first-line treatment is diet, weight control and physical activity. If the blood sugar(glucose) level remains high despite these measures then tablets to reduce the blood glucose level are usually advised. Insulin injection is needed in some cases. Other treatment includes reducing blood pressure if it is high, lowering high cholesterol levels and also using other measure to reduce the risks of complications. Type 2 diabetes tends to develop gradually (over weeks or months). This is because intype 2 diabetes you still make insulin (unlike in type 1 diabetes). However, you develop diabetes because

1) You do not make enough insulin for your body's needs;

2) The cell in your body do not use insulin properly. This is called insulin resistance. The cell in your body become resistant to normal levels of insulin. This means that you need more insulin than you normally make to keep the blood sugar (glucose) level down.

SIGNS AND SYMPTOMS

Signs and symptoms of type 2 diabetes often develop slowly. In fact, you can have type 2 diabetes for yeand not know it. Look for:

- Increased thirst, Frequent urination, Increased hunger, Unintended weight loss, Fatigue, Blurred vision, Slow-healing sores, Frequent infections, Areas of darkened skin, usually in the armpits and neck.

HOW INSULIN WORKS

Insulin is a hormone that comes from the gland situated behind and below the stomach (pancreas).

- The pancreas secretes insulin into the bloodstream.
- The insulin circulates, enabling sugar to enter your cells.
- Insulin lowers the amount of sugar in your bloodstream.
- As your blood sugar level drops, so does the secretion of insulin from your pancreas.

THE ROLE OF GLUCOSE

- Glucose comes from two major sources: food and your liver.
- Sugar is absorbed into the bloodstream, where it enters cells with the help of insulin.
- Your liver stores and makes glucose.
- When your glucose levels are low, such as when you haven't eaten in a while, the liver breaks downstored glycogen into glucose to keep your glucose level within a normal range.

RISK FACTORS

Factors that may increase your risk of type 2 diabetes include:

- **Weight, Fat distribution, Inactivity, Family history, Race, Age, Prediabetes, Gestational diabetes, polycystic ovarian syndrome.**

COMPLICATIONS.

Although long-term complications of diabetes develop gradually, they can eventually be disabling or even life-threatening. Some of the potential complications of diabetes include:

- **Heart and blood vessel disease, Nerve damage (neuropathy), Kidney damage, Eye damage, Diabetes increase sleep, Slow healing, Hearing impairment, Skin conditions, Sleep apnea, Alzheimer's disease.**

HAHNEMANN AND CONSTITUTION-

Dr Hahnemann gives as a fair idea on the importance of the constitution in aphorism 5 of the organon of medicine, wherein he states "useful to the physician in assisting him to cure are the particulars of the most probable exciting cause of the acute diseases, as also the most significant points in the whole history of the chronic disease,to enable him to discover its fundamental cause, which is generally due to chronic Miasm. In these investigations, the ascertainable **physical constitution** of the patients (and intellectual character, his occupation, mode of living and habits, his social and domestic relations, his age, sexual function etc., are tobe taken into consideration. Thereafter, at least at 20 places he mentions about the constitution in different context. He mainly refers constitution to the inherent nature of the individual. Hahnemann usedthe word Beschaffenheit in German, which usually translated as constitution in relationship to the Latin root "constitution" in homoeopathic works. Chamber Dictionary defines constitution as the natural condition of the body or mind; disposition.

HOMOEOPATHY AND DIABETES

Diabetes is a disease, the origin and the cause of which has little known and hidden in obscurity, has naturally taxed the energies of medical profession in all ages. Hence there is a vast array or various medicines which have been prescribed for this compliant. Historically diabetes been treated with great number of specifics proposed for its treatment and it is not surprising. The reason for this being the irremediable character of the disease[25].

CONSTITUTION AND DIABETES

Constitutional approach means where the mind, physical make up, general behavior, along with particulars of the disease will be considered in the totality. There is a long running debate aboutthe consideration of mind for prescribing by homoeopaths. And one more important thing is which aspect is to be given importance or the whole, for this master Hahnemann has explained in his organon of medicine in aphorism number 211 which reads, "This holds good to such an extent, that the state of the disposition of the patient chiefly demandsthe selection of the homoeopathic remedy[27]".

Remedy which covers the mental state and the general symptoms of the patient has a greater possibility of curing than the one that covers the particulars[27].

Diabetes is a constitutional disorder and it is an off shoot of constitutional defects (genetic factors and altered immunity) having an impact on the entire constitution of an individual. Hence it calls for an in-depth constitutional approach for its cure. Homoeopathy is based on theprinciples that disease is a total application of body. Moreover, homoeopathy recognizes importance of underlying causes such as genetic and inherited factors as the root of any ailmentof the body. Homoeopathic constitutional medicine prescribed in such conditions covers those criteria and so it is very crucial in management of deep rooted diseases[25].Concept of disease in homoeopathy is that disease is a total affection of mind and body, the disturbance of the whole organism. Individual organs are not the cause of the illness but the disturbance at internal level (i.e., life-force or vital energy). Therefore, homoeopathy does not believe in giving different medicines for different afflicted parts of body but rather give a constitutional remedy which will cover the disturbance of the whole person.

H A ROBERTS OPINIONS ABOUT DIABETES

The view point of the modern psychologist reflects the theory that the vast majority of human illnesses are traceable to dysfunctions of the glandular system. He saw that the function of some of the ductless glands is to secrete a minute quantity

of the specialized product in the system a secretion that has a vital bearing on the health of the. whole constitutions. In many cases this secretion of a normal gland is so minute that itapproaches the homoeopathic attenuation. Like homoeopathic remedies these glands also helps in maintaining the health with infinitesimal amounts of the secretions, we can hardly fail to see the important relationship this homoeopathic remedy may hold to the manifestations of the endocrine dysfunction andto the balance of the ductless glands. His observation about insulin that once insulin is given patient tends to depend on it and thereis little hope of establishing normal balance.

H A ROBERTS SPEAKS ABOUT CONSTITUTIONAL APPROACH FORDIABETES

We find many suitable remedies for sugar in urine in the repertories and most of the remedies listed are deep acting and have their respective emotional states. Diabetic patient presents with the subjective symptoms which will guide us to the remedy or hemay give a history of emotional shock preceding the present affliction that will lead to you a remedy. The symptoms are clearly marked such that the constitution cannot be overlooked, sometimesit is indicating a constitutional remedy which has not proved to produce sugar imbalance. If thepatient improves, we are justified by adding this as a clinical note to the existing. With this medicine if the general health is raised even though the lower sugar threshold remains the same not to be worried because we may safely rely on the remedy which maintainsgeneral improvement and not to be too anxious over the sugar output.

RICHARD HUGES ON DIABETES

It must always be of high importance, but it is not in the nature of the case and by the confession of its advocates, curative. Sometimes indeed under its use nature relieved of much ofher burden, asserts her recuperative power and when the pristine consequences. But too often hediabetic regimen proves but a continuous and most irk some palliative that the least abatement of its rigid restrictions is followed by an increase in the malady and the patient at length succumbs under pulmonary disease, carbuncle, or simple exhaustion of the power of the life. Until we can do more than cut off the supplies, until we can attack the morbid process itself we cannot consider ourselves in a position to cure diabetes.

When we talk about disease like diabetes, we take in consideration terms of management ratherthan cure, this is because general management measures like dietary measures and daily exercise etc are mandatory, hence along with constitutional remedy general management has a vital role in the cure and management of diabetic patients which not only treats the patients superficially but also drives the symptoms away and heals the patient from within. Undoubtedly one can prove that homoeopathy is the medicine of future.

As diabetes is a disease which shows constitutional disturbance and it has great geneticpredisposition and chances of heritable transmission so also this condition is a truly chronic in its form so this is a true chronic disease with miasms in its background. We cannot be specific about the Miasm of the diabetes as it can establish itself in all the three miasmatic states and so we can consider it as a multi miasmatic disease. The expression of diabetes in different miasmatic states is discussed below.

MIASMATIC BACKGROUND OF DIABETES

Predisposition to beta cell destruction is the main causative factor in primary Idiopathic diabetes mellitus. The presence of this predisposition corroborates with the basic conception in homeopathy about the natureand origin of all Chronic diseases. We must keep in mind Dr. Kent's 7th observation in this context. He arrived at the observation by treating several such incurable patients. Homoeopathically, Non-insulin dependent Diabetes Mellitus is either due to Psora or Sycosis or both. Psora leads to functional deficiency, Sycosis leads to incoordination and a combination of the two leads to simultaneous presence of both the conditions. These cases do not generallyrequire exogenous insulin but if persist for a long time, being maltreated or non-treated, cellular destructionmay finally

take place and non-Insulin dependent cases may turn to be Insulin dependent. Until then, the prognosis ofthese cases is better and the patients may be cured as the condition is reversible. But the medicinal treatment must be supplemented by proper dietetic management and physical exercise to reduce obesity. Diet control and adequate physical exercise alone may help to control the progress of these conditions. If obesity is reduced, Insulin receptor becomes much more effective and the Insulin resistant state steadily improves resulting in normalcy of blood sugar level. But unless the predisposition is corrected by anti-miasmatic constitutional treatment thepatient will not be cured and slightest error in diet and regimen will lead to a relapse of the condition[16].Diabetes mellitus comprises the pseudopsoric miasm. The pseudopsoric miasm is also known as Tubercular miasm. It is a combination of both Psora and Syphilitic miasm. Tubercular miasm is usually characterized by problem child i.e., slow in comprehension, dull, unable to keep a line of thought, unsocial,morose. He/she gets relief from offensive foot or axillary sweat which when suppressed often induces lung troubles or some other severe disease. The patient's mental symptoms tend to be ameliorated by an outbreak of an ulcer. The slightest bruise suppurates; the strong tendency is to the formation of pustules. Asa general rule, the patient is very intelligent, keen observer and a programmatic planner who wants his life always busy but possesses a sedentary lifestyle.

INDICATION OF MIASM

As the miasm progress and predominates, weight loss, depreciation and destruction are the first indicationof this miasm. Other indications are cosmopolitian habits, mentally keen but physically weak. Symptoms are ever changing. Rapid response to any stimuli (e.g. any slightest change of weather or atmosphere).

Emaciation instead of taking proper diet and drink, tendency to cough and cold easily, desire and cravingunnatural things to eat, with desires and cravings for narcotics such as tea, Coffee, **tobacco** and any other stimulants have often their origin

in psoric or tubercular miasm. They sometimes have constant hunger and eat beyond their capacity to digest or they have no appetite in the morning but hunger for othermeals.

THERAPEUTIC APPROACH TO DIABETES MELLITUS

There are many different modes of intervention in case of diabetes mellitus through homoeopathy.Physicians do use majorly three modes they are

Drugs in tincture form- Mother tinctures

Drugs involving the sectors(dilutions) - Acute remedies

Drugs covering the constitution

MOTHER TINCTURES AND THEIR INDICATIONS

ABROMA AGUSTA

Great uneasiness feeling of extreme prostrationLoss of flesh with rapid emaciation

Burning sensation all over the body with thirst for large quantities of water.

CEPHALANDRA INDICA

The grand medicine for diabetes mellitus and insipidus Glycosuria with intolerable burning sensation all over the body.

Especially adapted to people oversensitive to noise and external environment.Dryness of mouth with thirst for large quantity of water at a time.

CHIONANTHUS VIRGINICA

Diabetes mellitus with high specific gravity, Frequent micturition with bile and sugar in urine. Pancreatic disease and other and glandular disorder.

GLYCERINUM

Profuse and frequent micturition and increased specific gravity and sugar It is long deep acting remedy building up tissues and so it is of great use inmarasmus, mental and physical debility, diabetes etc. It seems to improve the general state of nutrition in its secondary action.

GYMNEMA SYLVESTRA

It is almost specific for diabetes mellitus

Decreases sugar in urine, patient puts on flesh and weight, appetiteimproves. Mental physical sexual spheres improves predominantly Profuse urination with large quantities sugar and feels weak after passing it.

HELONEAS DIOICA

Diabetes 1st stage urine profuse clear saccharine Lips dry stick together with great thirst restlessnessemaciation. Mentally irritable and melancholic

Albuminuria acute or chronic during pregnancy with drowsiness unusually tired.Sensation of weakness dragging and weight in the sacrum and pelvis with great languor prostration are excellent indications.

ACID PHOSPHORICUM

Young people who grow rapidly and who are overtaxed mentally andphysically. Debility from loss of vital fluids

Bad effects from grief anguish care o disappointed love

Frequent and profuse urination forcing the patient to rise often in the night

RHUS ARROMATICA

Diabetes with large quantities of low specific gravityurine. Pale albuminous urine

Severe pain before or at the beginning of the micturitition causing greatagony in children.

SYZYGIUM JAMBOLINUM

The most powerful remedy in diabetes mellitus Causes a marked diminution ofsugar in the urine.

Polydipsia polyuria and profound prostration and emaciation. Especially suited to people who suffer withchronic dyspepsia.

HOMOEOPATHIC DILUTIONS USED ON TOTALITY

ACETIC ACID:

Adapted to pale lean persons with lax, flabby muscles; face palewaxy. Diabetes with intense, burning, insatiable thirst

Violent burning pains in the stomach and chest, followed by coldness of skin

and cold sweat on the forehead.

ARGENTUM METALLICUM:

Diuresis urine profuse, turbid with a sweet odor. Frequent micturition. polyuria Emaciation and great weakness. Tall, thin, irritable persons. Ailments from abuse of mercury. Constitutional effects of onanism.

COCCA:

Persons who are wearing out under mental and physicalstrain. Longing for alcoholic liquors and tobacco. Incarcerated flatus; raises with noise and violence, as if it would split theesophagus. No appetite but for sweets.

Diabetes with impotency.

CUPRUM ARSENICOSUM:
Renal inefficiency and uremia, garlicky odour.
Diabetes urine with a high specific gravity; increased acetones and diabeticacid. Cramp in the calves. Worse after midnight, only relieved by getting out of bed and standing. Ulcers gangrene.
Boils on the scrotum, Purulent white discharge from the urethra [gleet]tingling and burning in the urethra pain in the prostrate and penis.

INSULINUM:
Restores the lost ability of oxidizing carbohydrate and storing glycogen inthe liver. In a persistent case of skin irritation, boils or varicose ulcerationwith polyuria.

KALI BROMATUM:
Adapted to large persons inclined to obesity. Nervous restless cannot sit stillmust move about or keep occupied; hands and fingers in constant motion.

LACTICUM ACIDUM:
Excessive thirst frequent and copious micturition; urine contains sugar.Skin rough and dry; obstinate constipation; tongue dry sticky gastric ailments. Debility and emaciation exertion.

LYCOPUS VIRGINICUS:
Diabetes mellitus and insipidus from some derangement of the central nervous system or sympatheticus. Copious flow of clear urine of great density, containingsugar, intense thirst; great emaciation.

NATRICUM SULPHURICUM:
Dryness of mouth and throat; great thirst for very colddrinks; Voracious appetite with boring pain; disgust while eating.
Increased urination especially at night, pains in small of back with burningurine. Worse in rainy weather, from water in any form.
Always feels better in warm dry air.

PICRICUM ACIDUM:
Emission profuse followed by great exhaustion.
Priapism, satyriasis. Brainfag; of literary or business people; slightest excitement,mental exertion or overwork brings on head ache.

PLUMBUM METALLICUM:
Constipation stools hard lumpy black like sheep dung.
Excessive and rapid emaciation general or partial paralysis; extreme, withanemia and great weakness.

SULPHURICUM ACIDUM:
Chilblains with gangrenous tendency. Carbuncles boils and otherstaphylococcal and streptococcal infection
Heartburn, sour eructations, craving for alcohol.

URANIUM NITRICUM:
Excessive thirst nausea vomiting ravenous appetite eating followed byflatulence abdomen bloated.
Complete impotency with nocturnal emissions. Organs cold, relaxed sweaty.
Diuresis, incontinence of urine. Burning in urethra with very acidurine. Unable to retain urine without pain.
Great emaciation, debility and tendency to ascites with general dropsy.

IJCSP PUBLICATION (IJCSPUB.ORG)

MATERIALS AND METHODS(METHODOLOGY)

The cases will be collected from following sources-

- O.P. Ds of Naiminath Homoeopathic Medical College, Hospital and research centre, Agra.
- I.P. Ds of Naiminath Homoeopathic Medical College, Hospital, and research centre, Agra.
- Peripheral OPDs of Naiminath Homoeopathic Medical College, Hospital, and research centre, Agra
- Rural Health Camps conducted by Naiminath Homoeopathic Medical College, Hospital, andresearch, Agra

Study duration

18 months duration

Selection of sample

30 cases.

INCLUSION CRITERIA: -

- Patients in age group 35 years to 60 years.
- Both genders.
- Patients suffering from subjective symptoms of Diabetes Mellitus.

EXCLUSION CRITERIA: -

- Patient having blood glucose level above 400mg/dl.
- Patients do not give consent to withdraw the conventional treatment, he has been taken.

Study design

- The research design is prospective, non-controlled experimental design.

Selection of tools

Data collection

Data collection will be done by interviewing the patients during first and subsequent follow-up.

Does the study require any investigation or intervention to be Conducted on patients or other humans or animals? If so, pleaseDescribe briefly.

Yes, appropriate investigation or intervention will be conducted on patient.

Basis of Selection of Drug:

Individualistic / constitutional / Anti-miasmatic were given to them according to the presenttotality of symptoms.

Auxiliary Line of Treatment:

Counselling for recording stress, anxiety and other host related factors favoring the disease,Diet correction if necessary & life-style modification.

Criteria of Improvement:

The results were calibrated into the following categories:

MARKED IMPROVEMENT: General improvement at all levels. A feeling of well-being of thepatient mentally and physically. Improvement in symptoms and signs.

MODERATE IMPROVEMENT: Moderate symptomatic improvement of the patient. Generalimprovement only at certain levels.

NO IMPROVEMENT: No improvement at any level. No improvement in any sign and symptoms,but treatment still going on.

OBSERVATIONS & RESULTS

Age Distribution 30 patients belonging to the age group 35- 60 were selected for study. Among the30 patients maximum prevalence of Diabetes Mellitus was noted between 41-50 years of age(50%).The second highest prevalence was found in age group 51-60 (40%) and next age group30-40 yrs (10%).The distribution is presented in table below, also the diagrammatic representation is furnished.

Age	**30-40**	**41-50**	**51-60**

SUMMARY

This study was done on patient suffering from Diabetes Mellitus type 2. The objective of study was

- To understand the role of constitutional remedies in treatment of DM Type 2
- To understand the which potency is more effective in treatment of DM Type 2.
- To prevent the complication and recurrence and provide the cure in rapid and gentle way.

To educate the people by the cause and aware about the Homoeopathic treatment of DMT2

In the study of 30 cases there are 21 cases improved 8 cases are worse and 1 case has no change from the homoeopathic medicine which are selected by taking appropriate rubric from homoeopathicmedical Organon of Medicine, this modern Organon of Medicine arranged in alphabetical and more Nosological terminology in the form of rubric which are helpful to select the repertorization. Most ofrubric related to diabetic mellitus type 2 arranged in clinical chapter.Miasmatic evaluation of all the cases revealed sycosis to have maximum predominance as fundamental miasm in 20 (66.67%) cases. And psora, sycosis, tubercular miasms share equal predominance as dominant miasms in 9 (30%) cases each.

Constitutional medicines were given to all the patients and along with that general management guidelines in the form of diet charts and exercise guidelines were also explained. Follow up analysis of the patient's state and regularity of general management guidelines followed were assessed, patients who followed general management regularly along with constitutional treatment were 14cases out of which 12 cases showed marked improvement in their health status when compared to the other group with occasional andirregular general management habits. Hence, we can conclude that homoeopathic treatment with dietary and exercise guidelines when strictly implemented is the best method of approaching type 2 DM.

RESULT OUTCOME-

1. There is a significance difference in the prevalence of DMT2 male 20(66.67%) and female 10(33.33%)
2. APD, osteoarthritis and hypertension are the most common associated complaints observed alongwith DM in this study.
3. According to the miasmatic evaluation of the 30 cases taken for the study I found that Sycosis ispresenting maximum predominance as fundamental Miasm in 20 (66.67%) cases. And Psora, Sycosis, tubercular Miasm share equal predominance as dominant Miasm in 9(30%) cases each reported for the study. Pathological survey of the disease also reveals sycotic – tubercular
4. predominance
5. Along with the constitutional treatment general management in the form of diet chart and exercise guidelines were given to the patient and their effective application is also assessed on subsequent follow-ups.
6. According to the need of the cases some acute remedies were prescribed in between and alsoantimiasmatic remedies.

Evaluation of the symptoms before and after the treatment reveals that there is significant improvement in all the symptoms considered before and after treatment. Symptoms like hyperglycemia which was seen in almost all 30 (100%) cases, but after treatment only 10 (33.33%)cases only showed hyperglycemia that too with less intensity. And also noticed in the symptom weakness which is expressed by 23(76.67%) cases before treatment is minimized to 4 (13.33%) cases after treatment.

7. All the cases were worked out and the constitutional similimum was selected and patients wereobserved on follow ups initially spaced at a gap of 2 weeks and later 1 month duration.
8. Along with the constitutional treatment general management in the form of diet charts and exercise guidelines were given to the patient and their effective application is also assessed onsubsequent follow-ups.
9. Potency selection was done based on the standardized guidelines in the SCR according to thesusceptibility and sensitivity of the patient.
10. Few cases allopathic medication was gradually tapered and many were strictly on homoeopathictreatment alone.
11. According to the need of the cases some acute remedies were prescribed in between and also antimiasmatic remedies.
12. Diabetes according to the modern perspective is a disease of multicentric origin, with multi-dimensional presentation and so the most accurate approach is the holistic approach, where simple reduction of the blood glucose levels is not the motive instead it induces disease managing efficacy of the individual which is understood by the general well-being of the patient irrespective of the plasma glucose concentration.

My encounter with Late Dr. Vishpala Parthasarthy

Dr Rajiv Rui Viegas Peres

M.D(Hom), Assistant Professor Organon Department, Aarihant Homoeopathic Medical College R.I, Gandhinagar, Gujarat

My first meeting with Late Dr. Vishpala Parthasarthy Madam was in September 2012 at hotel Villagio, state of Goa during a seminar organized by Njh team in collaboration with I.C.R based on the theme of cardiovascular and metabolic ailments and its homoeopathic management. Dr Vishpala Madam was wearing a green sari and a sweet smile on her face. I was pursuing my post graduate studies and had come there in pursuit of knowledge. Little did I know that I was going to be in the galaxy of modern pioneers.

It was a small gathering of around 40 homoeopaths. Amongst the great ones present there were Dr. N.L Tiwari Sir, Dr Phansalkar, Dr Prashant Tamboli, Dr A.T Jagose Sir, and of course the only lady who sat right in front was Dr Vispala Ma'am. My Post graduate colleagues from Belgaum, Karnataka had also come to witness the programme. We learnt about diabetes mellitus, cardiovascular problems and in the evening Dr Vishpala Madam spoke to us, she motivated us to bring out the unknown potential inside us through writings. It seemed all new then but her voice was very reassuring. I wanted to prove myself useful, however after the seminar ended, soon we got back into my old ways of balancing between studies and practice. Years rolled by and I used to closely follow Njh articles because it was helpful to select interesting articles for journal club meetings with our colleagues both during my internship as well as post graduate days. I was not a subscriber still. My journey as a writer began only in 2018 after my mother's death. Writing is what gave me solace. In November 2019 I met my teacher Dr.Shahala Nadaf Madam for the 21st All India Homoeopathic Scientific Seminar organized at Belgavi, Karnataka it just before covid 19 had been officially announced. Dr Shahala was one of the editors of Njh and she appreciated my articles which had appeared in the E-magazine Homoeopathy for Everyone. It was upon her insistence that I became a lifetime member and subscriber of Njh, When I started writing for Njh, there I came across Dr Shobha Shah and Dr Satish Kanodia who were both Njh core team members. I often began contributing articles to Njh, at that time I was working as an Assistant Professor in Shri Kamaxidevi Homoeopathic Medical College, Shiroda, Goa. During those years whenever I used to go for CME frogrammes I was getting acknowledged for my work which appeared in the Njh monthly magazine.

During Covid Njh organized webinar's and I used to enjoy attending them. One such programme that I clearly recollect now is the one on the theme of Headache and Dr Praveen Kumar shared some lovely cases. Post covid I migrated to Gandhinagar, Gujarat to teach as an Assistant Professor in Aarihant Homoeopathic medical college & R.I. My superior was also contributing articles to Njh and our department was making news. Soon I was made a member of an Author's group on whatsapp in which Dr Vishpala Madam would respond promptly in case I raised any

queries. Njh always provided me with new thought-provoking themes such as Anxiety, mind rubrics, paediatric problems, etc. It opened a whole new avenue before me and the editors did their bit to reframe the titles for my articles or sometimes by asking certain documents in order to confirm the authenticity of results. The covid issues were also very interesting as everyone in homoeopathy could find latest developments in terms of how it was managed. In August 2023, I had been to another such CME at Motiwala Homoeopathic Medical College, in Nashik, there I met a resource person who recognized me from the stage only because of reading my articles on Njh. During lunch break he asked me why I write for Njh as it was not a peer reviewed journal?. He asked me to write only in peer reviewed journals. For me personally, Njh gave me a free hand in writing my cases as they appeared or progressed in my clinical practice which no other journal allowed. Most peer reviewed journals made me fill up columns in a certain prescribed way and on account of this my cases lost its actual beauty. Njh did ask me for evidence of results but never made me change my way of presentation. I always looked 2-3 months ahead for themes and prepared in advance whenever possible. The last article which appeared was on Periodic table row 6. The next article on panic disorders was ready but our beloved Editora had left this world filling our hearts with sorrow. Never did she make it known to us of her illness. I regret not attending the seminar in Baroda last year, where Dr Vishpala herself had come, at least I could have seen this jewel a second time. Nevertheless when Njh announced Homoeoseminar 3.0 at Atal Bihari Vajpayee Auditorium, Rajkhot on 8th January 2024, I decided to pay my shradanjali to Late Dr Vishpala Madam by going there. Here I could meet the fabulous team of young editors of Njh, many of whom I have never seen before. I submit to you all with tons of gratitude for giving me a chance to share my clinical cases through my favourite journal Njh ever since my undergraduate days, where I would enjoy reading articles of Dr Jagose Sir, Dr Ajit Kulkarni Sir, Dr Praful Barwalia Sir, and many others. Dr Vishpala madam gave me the opportunity to write on this same platform. I cannot thank her enough! for this grand opportunity. Dr Vishpala made life of many young students like me. May her noble soul guide the homoeopathic world to persevere in propagating the seeds of homoeopathy. Her enormous contribution can never be forgotten!

"COMPETENCY BASED DYNAMIC CURRICULUM AT FIRST B.H.M.S CLINICAL POSTING- Sample of two acute cases discussion"

Author: Dr. Rajiv Rui Viegas Peres

Assistant Professor, Department of Organon of Medicine, Aarihant Homoeopathic Medical College & R.I, Swarrnim University, Gandhinagar, Gujarat

OBJECTIVE : To demonstrate integration of first year subjects(Organon, Materia Medica, Repertory, Pharmacy, Anatomy, Physiology) through an acute cases

Abstract: This case study aims to highlight the integration among st all first year subjects done to the O.P.D level cases observed by the first B.H.M.S students as prescribed by National commission for homoeopathy through the newly introduced Competency based dynamic curriculum (C.B.D.C) in 2023. This kind of integration would be an exhaustive exercise and needs a thorough study of the case prior to the actual evaluation, however, it fosters a comprehensive understanding of each case by making the results less subjective.

Methods: Successful acute cases at O.P.D level were selected whose prescription remedy was part of 1st year syllabus and after that drug was dealt by another teacher. The process of medical logic was applied to emphasize the knowledges of different first year subjects come together contributing to the similimum.

Results: The two acute cases met systematically with the prognostic factor for guidelines laid down in the Organon of Medicine for assessment of individual patient characteristics, disease progression and treatment response according to homoeopathic principles.

Conclusion: This study incorporates case-based learning at early first B.H.M.S level in order to familiarise medical graduates to utilise paraclinical subjects to enhance precision and efficacy of homoeopathic management. It encourages the young learners to utilise every subject that they learn, ultimately contributing to evolution of the patient centered healthcare.

Keywords: Acute case based learning----C.B.D.C----Integrated learning----Homoeopathic prescriptions

Case 1 18years Male Studying B.Com, thin, Emaciated

Date of case taking: 08/5/2024

Presented with complaints of breathlessness, 2 episodes requiring hospitalisation at Midnight. Presently on Budecot inhaler, Deriffilin Tab, Montelucas Tab since last 1 month. Has to sit up during attack and feels tightness of chest. Ailments from dust allergy. Worse by lying down specially at midnight. Expiration is difficult. No much expectoration. Tired easily while playing football. Decreased appetite. Thirst for small quantity often, prefers warm drinks since respiratory disease. He is diagnosed by Pulmonologist as suffering from Asthma.

Had to be convinced of importance of homoeopathic treatment to wean allopathic treatment. His younger sister is on strong Asthma treatment given by same pulmonologist and fully dependent on his medications. Mother is concerned about him but he is afraid of dying of suffocation hence doesn't want to stop allopathic treatment. Mothers suffers from allergies to dust. Father had hypertension.

On Examination: R.S- Wheezing present.

During an acute attack, excited by allergic condition, be it chemical irritant or industrial dust small airway restrict and narrowing due to smooth muscle bronchoconstriction, airway oedema with increased secretions and inflammation. These alterations basically occur as a result of hyperresponsiveness in extracellular matrix, airway smooth muscle and parenchyma.

Wheezing is a high-pitched piping or whistling sound resulting from partial airway obstruction. Wheezes are usually louder and more persistent during expiration. It has a musical quality occurring with either inspiration or expiration. The pitch of the wheeze is due to the linear velocity of air jet, which is broken into turbulent flow pattern of the airways and is not related to the size of the airway where it is produced. During attacks of asthma the wheezing sounds may be so loud that they can be heard without a stethoscope.

Uncommon features of this case are the decreased appetite, modality of better by sitting up, time of worsening of complaints being midnight. And the concomitant of thirst for small quantities of warm water often. All indicative of Arsenicum Album. Arsenicum album is a remedy for allergic problems. 1M potency was chosen as the symptoms are indicative of high susceptibility. Single dose. Placebo for 1 month. Aphorism no 5 tells that acute disease search for exciting cause. In repertory check for Asthma worse at midnight and better by sitting up.

Follow up after 1 month patient returned to inform that He could play football without getting tired. No episode of asthma. Appetite has improved. Overall, 70% improvement. Placebo continued. Inhaler reduced to once a day from twice a day. Gradual tapering planned.

Case 2 Mrs M.S Age: 47yrs Housewife Mother of two children

Date of case taking: 20th February 2024 Gandhinagar

Patient presented with complaints of severe pain in right trapezius after twisting her ankle while wearing high heels and hence developed pain in upper back dorsal region of back since 2 days. Pain progressively increasing therefore she rushed to the physiotherapist since yesterday which is being continued. She has difficulty in lifting the arms, shrugging the shoulders and tilting the neck. Patient had consumed Rhus tox but failed to relieve. Pain relieved by warm applications, better by rubbing, <by slightest draft of cold air, >lying only on back, >standing so last two days trying to stand and work at home. Pain makes her very restless but she doesn't change sides in bed. Rather lies straight in bed.

Prescription: Ruta 1M, 1 single dose on 20th February

Follow up on 21st February: Pain relieved by 50%

Follow up on 22nd February: Pain relieved by 70%

Follow up on 23rd February: Pain relieved by 95%

For repertorisation which is bridge between patient and Materia Medica we use repertory to find out which remedies are covered by the characteristic symptoms which in this given case are 1)Pain aggravated by draft of cold air 2)Modality of pain relieved by standing

Comparison is done with Arnica, Arnica is aggravated by lying on painful side hence it gets eliminated.

Referring Materia Medica of Allen's Key notes in Ruta, we find the symptom: Lameness after sprains(Exciting factor; Aphorism no 5), Backache relieved by lying on the back. Also ruta has affinity for fibrous tissues tendons of back. Also relieved by warm and restlessness is covered by Ruta

Pharmacy part helps to know source of drug and decide repetitions and power (Potency and scale selection).

Anatomy of Trapezius muscle will help us know the three tendon heads of insertion which have resulted in this muscular sprain, these are the same locations given by the patient expressed as points of tenderness.

The fact that patient is unable to shrug the shoulders or lift the arms and points of tenderness extending below the lower angles of scapula clearly fit with the surface markings of this 'V' shaped muscle in the middle of the back. Physiology or functional anatomy can be learnt through this case in relation to the Trapezius.

ABSTRACT

I worked on patients suffering from Epileptic convulsion with age between 2 years to 10 years as inclusion criteria in the cases. It was observed through comparative study which verified the importance of keeping these symptoms. Patients were relieved to great extent by the medicines which are obtained by the totality of symptoms. Epileptic convulsion is the disorder characterised by a staring spell, uncontrollable jerking movement of the arms and legs, loss of consciousness or awareness, fatigue, body ache, Persistent EPILEPSY, weight loss, discomfort feeling, weakness & temporary confusion. Psychic symptoms such as fear, anxiety. Homoeopathic constitutional treatment based on the individual case is the most suitable treatment and would aim to heal the underlying physical crisis causing the Epileptic convulsion. The remedies work by stimulating the body's natural ability to heal itself, acting as a catalyst for healing. Homeopathy can be of assistance in retrieving normal health and treating any other physical issues and sequel related to Epileptic convulsion. Homoeopathic medicines can also prevent relapse of Epileptic convulsion.

Methods: Randomised controlled trial study design has been adopted to know the efficacy of homoeopathic treatment in cases of Epileptic convulsion and its complication. A total number of 30 patients, showing features of uncontrollable jerking movement of the arms and legs body ache, low grade EPILEPSY, discomfort, temporary confusion& weakness were selected who were fulfilling the inclusion and exclusion criteria. Follow up has been taken for two months with at least six visits. From guardian of every subject, a written informed consent has been taken.

Result: All data were calculated from the study of 30 individuals. Statistical tests regarding the various parameters were conducted and ratio of cure was found out in relation to the medicine used
Conclusion: Homoeopathic treatment, by considering the Repertorial approach, was more efficacious in cases of Epileptic convulsion. During treatment uses of placebo is also effective.

Keywords: Homoeopathic treatment, Repertory, Epileptic convulsion, Spider Group of Drugs, Tarantula.

INTRODUCTION

Epilepsy is a chronic noncommunicable disease of the brain that affects around 50 million people worldwide. It is characterized by recurrent seizures, which are brief episodes of involuntary movement that may involve a part of the body (partial) or the entire body (generalized) and are sometimes accompanied by loss of consciousness and control of bowel or bladder function. Seizure episodes are a result of excessive electrical discharges in a group of brain cells. Different parts of the brain can be the site of such discharges. Seizures can vary from the briefest lapses of attention or muscle jerks to severe and prolonged convulsions. Seizures can also vary in frequency, from less than 1 per year to several per day.

Signs and symptoms

Characteristics of seizures vary and depend on where in the brain the disturbance first starts, and how far it spreads. Temporary symptoms occur, such as loss of awareness or consciousness, and disturbances of movement, sensation (including vision, hearing and taste), mood, or other cognitive functions. People with epilepsy tend to have more physical problems (such as fractures and bruising from injuries related to seizures), as well as higher rates of psychological conditions, including anxiety and depression.

Causes

Epilepsy is not contagious. Although many underlying disease mechanisms can lead to epilepsy, the cause of the disease is still unknown in about 50% of cases globally. The causes of epilepsy are divided into the following categories: structural, genetic, infectious, metabolic, immune and unknown. Examples include:

- brain damage from prenatal or perinatal causes (e.g. a loss of oxygen or trauma during birth, low birth weight);
- congenital abnormalities or genetic conditions with associated brain malformations;
- severe head injury;
- a stroke that restricts the amount of oxygen to the brain;
- an infection of the brain such as meningitis, encephalitis or neurocysticercosis,
- certain genetic syndromes; and a brain tumor.

AIMS AND OBJECTIVES

The aim of this study is to apply group analysis to the Class Spider and to assess benefits of tarantula medicine for epilepsy treatment.

OBJECTIVE

- To study on the therapeutic utility of medicine belonging to spider group of homeopathic medicines in treatment of epileptic cases

- Study and compare the outcome of the formalized computer analysis to existing results and views of spiders for epilepsy treatment
- To study the homoeopathic management and its outcome through the various clinical cases of epilepsy in the patient of various age group ranging from 2 to 10 years.

REVIEW OF LITERATURE One seizure does not signify epilepsy (up to 10% of people worldwide have one seizure during their lifetime). Epilepsy is defined as having two or more unprovoked seizures. Epilepsy is one of the world's oldest recognized conditions, with written records dating back to 4000 BC. Fear, misunderstanding, discrimination and social stigma have surrounded epilepsy for centuries. This stigma continues in many countries today and can impact on the quality of life for people with the disease and their families. Multiple references to epilepsy can be found in the ancient texts of all civilizations, most importantly in the ancient Greek medical texts of the Hippocratic collection. For example, Hippocrates in his book *On Sacred Disease* described the first neurosurgery procedure referring that craniotomy should be performed at the opposite side of the brain of the seizures, in order to spare patients from "phlegma" that caused the disease . However, it was not until the 18th and 19th century, when medicine made important advances and research on epilepsy was emancipated from religious superstitions such as the fact that epilepsy was a divine punishment or possession. At the beginning of the 18th century, the view that epilepsy was an idiopathic disease deriving from brain and other inner organs prevailed. One should mention the important work in this field by William Culen (1710–1790) and Samuel A. Tissot whose work set the base of modern epileptology describing accurately various types of epilepsie. Homoeopathy is a holistic treatment approach and, as such, looks beyond a diagnosis to consider everything about an individual. Lifestyle, attitudes, personality, background, genetic factors, emotional states, and individual symptoms are all noted during a homoeopathic consultation and the design of a treatment plan.

Studies from India have reported incidence rates varying from 0.2 to 0.6 per 1,000 population. The incidence rates reported from India are comparable with developed countries and lower than most of the developing countries which ranged from 1.0 to 1.9 per 1,000 per year. Saha *et al*., reported an incidence rate of 0.42 per 1,000 per year from a 5-year longitudinal study in rural West Bengal, which was quite similar to the incidence rate of 0.49 per 1,000 per year reported by Mani *et al*., from the 1-year Yelandur study in rural area. However, the incidence rates reported from urban regions were quite variable with higher rate of 0.60 per 100 per year from an urban resettlement colony compared to 0.27 per 1,000 per year from urban area. The heavily concentrated migrant rural population in the urban resettlement colonies and slums in recent years might be one of the possible reasons for high incidence rate reported in urban resettlement colony. Thus, it is evident that there exists a wide rural-urban gap for incidence of epilepsy with likely hot spots in urban regions due to migrant rural population.

Table 1a: Prevalence of epilepsy in rural population of India

Author	Year of publication	Place of study	Study sample	Study instrument	Prevalence per 1,000	Remarks
Goel *et al.*[45]	2009	Dehradun, Uttrakhand	14,086 subjects through H-H survey of randomly selected villages	Modified WHO protocol	7.5	Screening followed by neurologic examination with the use of CT and EEG. Prevalence rate was 6.5/1,000 when neurocysticercosis was excluded
Sureka and Sureka[46]	2007	Churu tehsil, Rajasthan	172,442 subjects sampled through H-H survey	Standard validated Placencia's nine questions screening questionnaires	3.0	Case finding through H-H survey along with IEC activities, followed by neurologist confirmation using ILAE case definition
Murthy *et al.*[47]	2004	West Godhavari, Andhra Pradesh	74,086 subjects sample through H-H survey	Clinical assessment	6.2	All cases ascertained clinically had a plain and contrast CT
Saha *et al.*[48]	2003	West Bengal	20,842 subjects through H-H survey	Modified WHO protocol	3.6	Trained professionals screened the population followed by neurologist examination
Pal *et al.*[40]	1998	Bishnupur block, West Bengal	40,574 children aged 2-18 years through H-H survey and key informant interview	Screening questionnaire used in Ecuador	3.2	Prevalence of active epilepsy was 3.2/1,000 as per ILAE case definition and the prevalence was 5.5 (after adjusting for survey sensitivity)
Kokkat and Verma[49]	1998	Haryana	8,595 subjects in four adjoining villages through random survey	Elaborate screening instrument on seizure and paralysis	8.0	A cross-sectional survey of four adjoining villages was carried out. Epilepsy, active and inactive were defined
Kapur and Isaac[16]	1978	Bangalore, Karnataka	4,209 subjects through H-H survey	Indian Psychiatric Survey Schedule (Kapur *et al.*, 1974	10.4	The study cross-validated the simple inexpensive method of case identification against H-H survey
Murthy *et al.*[17]	1978	Raipur Rani, Haryana	3,500 subjects selected by health staff referral in one village and H-H visit by psychiatrist in other village	Use of vignettes and interviewing of key informants	3.7	Not a true epidemiological study as more than half of the case finding did not come from H-H survey
Nandi *et al.*[18]	1975	Barasat, West Bengal	1,060 subjects through H-H survey	Questionnaire schedule, case record schedule as per ICD (1965 R)	10.4	Case definition as per WHO tech report series (1960)no.185 with minor modification
Sethi *et al.*[19]	1972	Lucknow, Uttar Pradesh	2,691subjects through H-H survey	Questionnaire for assessment of psychiatric state of the family	2.2	Screening was conducted by team of clinical psychologist, physician with psychiatric training, and social worker followed by psychiatrist examination; sex specific rates: Male (4.1) and female (0)
Elnagar *et al.*[20]	1971	Hooghly, West Bengal	1,383 subjects through H-H survey	Case finding questionnaire	4.3	Case finding was followed by detailed work-up and psychiatrist examination
Gopinath[21]	1968	Bangalore, Karnataka	423 subjects through H-H survey	A survey questionnaire giving various symptoms of mental illness	2.4	A team of doctors, psychologists, and social workers interviewed the head of the household and elicited information about presence of these symptoms

WHO = World Health Organization, ICD = International Classification of Diseases, ILAE = International League Against Epilepsy, CT = computed tomography, H-H = house-to-house

Table 1b: Prevalence of epilepsy in urban and semiurban populations in India

Author	Year of publication	Place of study	Study sample	Study instrument	Prevalence per 1,000	Remarks
Singh *et al.*[54]	2012	Jamalpur, Punjab	15,750 subjects through H-H survey	Modified WHO protocol	7.2	Initial screening, followed by epileptologist confirmation using ILAE case definition. Inactive epilepsy, nonepilpetic seizure, and single seizure were excluded
Raina *et al.*[55]	2011	RS Pura, Jammu	3,966 children <10 years identified through H-H survey	Modified WHO protocol	2.0	Initial screening by Anganwadi workers followed by neurologist examination using ILAE case definition
Banerjee *et al.*[56]	2010	Kolkata, West Bengal	52,377 subjects through two-stage H-H survey of stratified random sample	NIMHANS screening questionnaire	5.7	Initial screening followed by neurologist examination using ILAE case definition
Banerjee *et al.*[57]	2009	Kolkata, West Bengal	16,979 subjects ≤19 years selected through two-stage H-H survey of stratified random sample	NIMHANS screening questionnaire	7.0	Initial screening by trained field workers followed by neurologist examination using ILAE case definition
Das *et al.*[58]	2008	Kolkata, West Bengal	5,430 elderly aged>60years selected through two-stage H-H survey of stratified random	NIMHANS screening questionnaire	2.6	Initial screening followed by neurologist examination using ILAE case definition. Prevalence of active epilepsy was reported

WHO = World Health Organization, ICD-10 DCR = International Classification of Diseases, 10th revision, Diagnostic Criteria for Research, ILAE = International League Against Epilepsy, NCC = Neurocysticercosis, H-H = House-to-house

Table 1c: Prevalence of epilepsy from mixed (both urban and rural) population in India

Author	Year of publication	Place of study	Sample	Study instrument	Prevalence per 1,000	Remarks
Pandey *et al.*[66]	2014	Chandigarh	3,684 children aged 1-18 years	Modified Placencia's screening questionnaires	6.2	6.99 for rural area, 5.48 for urban area, and 4.07 for active epilepsy. ILAE case definition was used
Shah *et al.*[67]	2009	Kashmir	15,218 children aged 6-18 years	A pre-structured questionnaire	3.2	Rural rate was 3.9 and urban rate was 2.96. ILAE case definition was used
Rajshekhar *et al.*[68]	2006	Vellore, Tamil Nadu	50,617 subjects through cluster sampling	Modified WHO protocol	3.8	Prevalence in the urban clusters more than twice that in the rural clusters (6.23 vs 3.04/1,000). NCC is the cause of nearly one-third of all cases in both the urban and rural regions
Srinath *et al.*[69]	2005	Bangalore, Karnataka	2,064 children aged 0-16 years through stratified random sampling	Multiple screening tools	10 (children aged 0-3 years) 7.0 (children aged 4-16 years)	The screening stage was followed by a detailed evaluation stage with use of ICD-10 DCR criteria. The rates were higher for rural followed by slum and urban
Mathai[74]	1971	Vellore, Tamil Nadu	258,576 subjects through a door-to-door survey	Elaborate checklist on seizure symptoms	8.97	The prevalence was9.8/1,000 for rural areas and 7.5/1,000forurban areas
Dube[73]	1970	Agra, Uttar Pradesh	29,468 subjects through H-H survey	No objective screening questionnaire	2.3 (active epilepsy) 3.2 (lifetime prevalence)	A team of psychologist, social worker, field investigator, and statistician did the initial screening which was not objective. Suspected cases were confirmed by psychiatrist

WHO = World Health Organization, ICD-10 DCR = International Classification of Diseases, 10th revision, Diagnostic Criteria for Research, ILAE = International League Against Epilepsy, NCC = Neurocysticercosis, H-H = House-to-house

DEFINITIONS AS PER DIFFERENT STANDARD TEXT BOOKS:

HARRISON:

A epilepsy (from the Latin *sacire*, "to take possession of") is a transient occurrence of signs or symptoms due to abnormal excessive or synchronous neuronal activity in the brain. Depending on the distribution of discharges, this abnormal brain activity can have various manifestations, ranging from dramatic convulsive activity to experiential phenomena not readily discernible by an observer. Although a variety of factors influence the incidence and prevalence of seizures, ~5–10% of the population will have at least one epilepsy, with the highest incidence occurring in early childhood and late adulthood.

HARSHMOHAN :

Epilepsy is a common neurological condition characterized by recurrent seizures (that usually occur unpredictably), loss of consciousness with or without body movements. It is derived from a Greek word Epi-upon, Leptos-seizures. It is also known as seizure disorder. Seizure is a phenomenon characterized by an excessive, hypersynchronous discharge of cortical neuronal activity (measured by EEG), featured by disturbances in consciousness, sensory motor systems, subjective well-being and objective behaviour.

CECIL:

Temporal lobe epilepsy (TLE), a subset of the seizure disorder family, represents a complex neuropsychiatric illness, where the neurological presentation may be complemented by varying severity of affective, behavioral, psychotic, or personality abnormalities, which, in turn, may not only lead to

misdiagnosis, but also affect the management. This paper outlines a spectrum of mental health presentations, including psychosis, mood, anxiety, panic, and dissociative states, associated with epilepsy that make the correct diagnosis a challenge.

CLINICAL FEATURES OF EPILEPSY

Epilepsy is caused by abnormal activity in the brain, seizures can affect any process your brain coordinates. Seizure signs and symptoms may include:

- Temporary confusion
- A staring spells
- Uncontrollable jerking movements of the arms and legs
- Loss of consciousness or awareness
- Psychic symptoms such as fear, anxiety or Deja vu

Symptoms vary depending on the type of seizure. In most cases, a person with epilepsy will tend to have the same type of seizure each time, so the symptoms will be similar from episode to episode.

Doctors generally classify seizures as either focal or generalized, based on how the abnormal brain activity begins.

Focal seizures

When seizures appear to result from abnormal activity in just one area of your brain, they're called focal (partial) seizures. These seizures fall into two categories:

- **Focal seizures without loss of consciousness.** Once called simple partial seizures, these seizures don't cause a loss of consciousness. They may alter emotions or change the way things look, smell, feel, taste or sound. They may also result in involuntary jerking of a body part, such as an arm or leg, and spontaneous sensory symptoms such as tingling, dizziness and flashing lights.
- **Focal seizures with impaired awareness.** Once called complex partial seizures, these seizures involve a change or loss of consciousness or awareness. During a complex partial seizure, you may stare into space and not respond normally to your environment or perform repetitive movements, such as hand rubbing, chewing, swallowing or walking in circles.

Symptoms of focal seizures may be confused with other neurological disorders, such as migraine, narcolepsy or mental illness. A thorough examination and testing are needed to distinguish epilepsy from other disorders.

Generalized seizures

Seizures that appear to involve all areas of the brain are called generalized seizures. Six types of generalized seizures exist.

- **Absence seizures.** Absence seizures, previously known as petit mal seizures, often occur in children and are characterized by staring into space or subtle body movements such as eye blinking or lip smacking. These seizures may occur in clusters and cause a brief loss of awareness.
- **Tonic seizures.** Tonic seizures cause stiffening of your muscles. These seizures usually affect muscles in your back, arms and legs and may cause you to fall to the ground.
- **Atonic seizures.** Atonic seizures, also known as drop seizures, cause a loss of muscle control, which may cause you to suddenly collapse or fall down.

- **Clonic seizures.** Clonic seizures are associated with repeated or rhythmic, jerking muscle movements. These seizures usually affect the neck, face and arms.
- **Myoclonic seizures.** Myoclonic seizures usually appear as sudden brief jerks or twitches of your arms and legs.
- **Tonic-Clonic seizures.** Tonic-clonic seizures, previously known as grand mal seizures, are the most dramatic type of epileptic seizure and can cause an abrupt loss of consciousness, body stiffening and shaking, and sometimes loss of bladder control or biting your tongue.

COMPLICATIONS OF EPILEPSY:-

Having a seizure at certain times can lead to circumstances that are dangerous to yourself or others.

- **Falling.** If you fall during a seizure, you can injure your head or break a bone.
- **Drowning.** If you have epilepsy, you're 15 to 19 times more likely to drown while swimming or bathing than the rest of the population because of the possibility of having a seizure while in the water.
- **Car accidents.** A seizure that causes either loss of awareness or control can be dangerous if you're driving a car or operating other equipment. Many states have driver's license restrictions related to a driver's ability to control seizures and impose a minimum amount of time that a driver be seizure-free, ranging from months to years, before being allowed to drive.
- **Pregnancy complications.** Seizures during pregnancy pose dangers to both mother and baby, and certain anti-epileptic medications increase the risk of birth defects. If you have epilepsy and you're considering becoming pregnant, talk to your doctor as you plan your pregnancy. Most women with epilepsy can become pregnant and have healthy babies. You'll need to be carefully monitored throughout pregnancy, and medications may need to be adjusted. It's very important that you work with your doctor to plan your pregnancy.
- **Emotional health issues.** People with epilepsy are more likely to have psychological problems, especially depression, anxiety and suicidal thoughts and behaviors. Problems may be a result of difficulties dealing with the condition itself as well as medication side effects. Other life-threatening complications of epilepsy are uncommon, but may happen, such as:
- **Status epilepticus.** This condition occurs if you're in a state of continuous seizure activity lasting more than five minutes or if you have frequent recurrent seizures without regaining full consciousness in between them. People with status epilepticus have an increased risk of permanent brain damage and death.
- **Sudden unexpected death in epilepsy (SUDEP).** People with epilepsy also have a small risk of sudden unexpected death. The cause is unknown, but some research shows it may occur due to heart or respiratory conditions. People with frequent tonic-clonic seizures or people whose seizures aren't controlled by medications may be at higher risk of SUDEP. Overall, about 1 percent of people with epilepsy die of SUDEP.

DIAGNOSIS:

To diagnose your condition, your doctor will review your symptoms and medical history. Your doctor may order several tests to diagnose epilepsy and determine the cause of seizures. Your evaluation may include:

A neurological exam. Your doctor may test your behavior, motor abilities, mental function and other areas to diagnose your condition and determine the type of epilepsy you may have.

Blood tests. Your doctor may take a blood sample to check for signs of infections, genetic conditions or other conditions that may be associated with seizures.

Electroencephalogram (EEG). This is the most common test used to diagnose epilepsy. In this test, electrodes are attached to your scalp with a paste-like substance or cap. The electrodes record the electrical activity of your brain. If you have epilepsy, it's common to have changes in your normal pattern of brain waves, even when you're not having a seizure. Your doctor may monitor you on video when conducting an EEG while you're awake or asleep, to record any seizures you experience. Recording the seizures may help the doctor determine what kind of seizures you're having or rule out other conditions. The test may be done in a doctor's office or the hospital. If appropriate, you also may have an ambulatory EEG, which you wear at home while the EEG records seizure activity over the course of a few days. Your doctor may give you instructions to do something that will cause seizures, such as getting little sleep prior to the test.

High-density EEG. In a variation of an EEG test, your doctor may recommend high-density EEG, which spaces electrodes more closely than conventional EEG — about a half a centimeter apart. High-density EEG may help your doctor more precisely determine which areas of your brain are affected by seizures.

Computerized tomography (CT) scan. A CT scan uses X-rays to obtain cross-sectional images of your brain. CT scans can reveal abnormalities in your brain that might be causing your seizures, such as tumors, bleeding and cysts.

Magnetic resonance imaging (MRI). An MRI uses powerful magnets and radio waves to create a detailed view of your brain. Your doctor may be able to detect lesions or abnormalities in your brain that could be causing your seizures.

Functional MRI (fMRI). A functional MRI measures the changes in blood flow that occur when specific parts of your brain are working. Doctors may use an fMRI before surgery to identify the exact locations of critical functions, such as speech and movement, so that surgeons can avoid injuring those places while operating.

Positron emission tomography (PET). PET scans use a small amount of low-dose radioactive material that's injected into a vein to help visualize active areas of the brain and detect abnormalities.

Single-photon emission computerized tomography (SPECT). This type of test is used primarily if you've had an MRI and EEG that didn't pinpoint the location in your brain where the seizures are originating. A SPECT test uses a small amount of low-dose radioactive material that's injected into a vein to create a detailed, 3-D map of the blood flow activity in your brain during seizures. Doctors also may conduct a form of a SPECT test called subtraction ictal SPECT coregistered to MRI (SISCOM), which may provide even more-detailed results.

Neuropsychological tests. In these tests, doctors assess your thinking, memory and speech skills. The test results help doctors determine which areas of your brain are affected. Doctor may use a combination of analysis techniques to help pinpoint where in the brain seizures start:

Statistical parametric mapping (SPM). SPM is a method of comparing areas of the brain that have increased metabolism during seizures to normal brains, which can give doctors an idea of where seizures begin.

Curry analysis. Curry analysis is a technique that takes EEG data and projects it onto an MRI of the brain to show doctors where seizures are occurring.

Magnetoencephalography (MEG). MEG measures the magnetic fields produced by brain activity to identify potential areas of seizure onset.

Accurate diagnosis of your seizure type and where seizures begin gives you the best chance for finding an effective treatment.

MANAGEMENT

Seizure type	*Choice 1*	*Choice 2*	*Choice 3*	*Choice 4*
Simple partial	Carbamazepine (alone/comb.)	Phenytoin	Primidone Lamotrigine Oxcarbazepine Lacosamide	Gabapentin Levetiracetam Zonisamide Tiagabine
Complex partial	Carbamazepine Lamotrigine	Phenytoin	Phenobarbital Zonisamide Oxcarbazepine	Valproic acid Primidone Topiramate* Tiagabine Vigabatrin**
Primary generalized	Valproic acid	Carbamazepine	Phenytoin	Phenobarbital
Tonic-clonic	Lamotrigine	-	Valproic acid	Topiramate Tiagabine
Absence	Lamotrigine* Ethosuximide	Zonisamide Valproic acid	-	-
Myoclonic atonic	Valproic acid	Clonazepam	Zonisamide	Felbamate* (alone/comb.)
Status epilepticus	Diazepam	Phenytoin	Phenobarbital	-
Psychomotor	Phenytoin	-	-	-
Lennox-Gastaut syndrome	Valproic acid Felbamate	Lamotrigine Topiramate Rufinamide	-	-

Work done in Homoeopathy:

HOMOEOPATHIC PERSPECTIVE OF EPILEPSY

Life is the invisible, substantial, intelligent, individual, coordinating power and cause directing and controlling the forces involved in the production and activity of any organism possessing individuality. Health is that balanced condition of the living organism in which the integral, harmonious performance of the vital functions tends to the preservation of the organism and the normal development of the individual. Disease is an abnormal vital process, a changed condition of, life, which is inimical to the true development of the individual and tends to organic dissolution.

INTEREPRETIONS OF THE TERM 'CONSTITUTION'

In Homeopathy, the term constitution seems to be used most frequently when referring to 'constitutional prescribing' to indicate the consideration of a wider, deeper totality than that called for by an acute episode. It is also used to differentiate between 'types' of patients by describing them according to various systems of classification, and in determining common and characteristic symptoms of disease.

Constitutional prescribing is not the same as chronic prescribing, since the patient does not have to exhibit any sign of chronic disease pathology to require a constitutional remedy. Constitutional prescribing does not simply address the present disturbance, but also the past and future. It is treating the patient's susceptibility (which may include the propensity to repeated acutes and any existing chronic disease), by addressing the inner disturbance which gives rise to outward disease symptoms. It treats the

manifest, the previously manifest, and also the potential to manifest. In this sense, it links in to the definition cited by Whitmont above, as does Margery Blackie's statement, 'The constitutional remedy is a picture of the sum total of the strengths and weaknesses of the person, mentally, emotionally and physically. It is in the early undiagnosable stages of illness that we must find the constitutional remedy.
Boger appears to regard the constitution as that which produces the characteristic, as opposed to common, symptoms of the disease. It is perhaps from this standpoint that Whitmont's complaint about a lack of differentiation between constitutional and non-constitutional factors arises.
The idea of constitutional typing arose long before Homœopathy: 'The conception of a patient in terms of healing agent is found even in Paracelsus ... 'stress in our drugs the cure and not the causes because the healing shows us the cause' and has its uses — 'According to the recognition of characteristic traits of a patient in an image of drug actions, one speaks in homœopathy of a lachesis case, of a sulphur man or a phosphorus type. The originally practical therapeutic consideration becomes a fruitful discovery and division principle for constitutions. However, like any model, the conception has also been misused. In Kathleen Priestman's introduction to Borland's Homœopathy in Practice she states, 'It has been found that certain remedies are indicated very frequently, and that many people exhibit symptoms which correspond to the symptom picture or 'drug' picture of each of these remedies. ... Unfortunately, over the years, it has become a common habit for homœopathic doctors to speak of the remedies as if they were the patients and vice versa.'
In Vithoulkas' writing, the term is generally used in the context of its strength (ie. a strong or weak constitution) when describing the response of an individual to morbific influences. He does not appear to advocate any kind of constitutional typing. 'The most important contribution of Hahnemann's exploration into the miasms is the concept that there exist layers of predisposition which underlie the waxing and waning of temporary ailments; these must be taken into account in treatment intending to be completely curative. In such cases, complete cure will take a relatively long time, while the prescriber systematically peels off layer upon layer of predisposing weaknesses by carefully prescribing each remedy based on the totality of symptoms in the moment. Hahnemann's miasms are extended to include all major disease diatheses as well as allopathic drugs and vaccines. However, many people regard Vithoulkas as one of the prime exponents of constitutional typing by remedy, resulting from his method of presenting remedies by their 'essences' and describing them in terms of patient
Constitution (Individual) Characteristic.

1. Emotional sphere
2. Intellectual sphere
3. Physical sphere

SUSCEPTIBILITY:

It is an inherent capacity in all living things to react to stimuli in the environment and represent a fundamental quality that distinguishes the living from non-living. It is the reaction of the organism to external influences.
Different types of roles which is played by it are:

- Maintaince of health.
- Evolution of constitution.
- Development of diathesis.
- Manifestation of disease.

- Process of recovery and cure.
- Evolution of drug picture.
- Manifestation of remedy(remedy reaction)
- Determination of dose and repetition.

SUSCEPTIBILITY AND HEALTH

An organism in perfect balance represents health. This fine balance, even the presence of adverse environmental factors, is a resultant of different processes that are going on within and within which maintain the optimum conditions. This fine regulation is feasible only as long as a normal response follows a given stimulus. This is possible only when the organism exhibits the normal susceptibility. Any change of this normal susceptibility will interfere the normal response. This interference of normal response will denote loss of balance as evidenced by the development of abnormal sensations and functions, which we call disease. As normal susceptibility is essential for the maintenance of health, disease results from the abnormal susceptibility.

SUSCEPTIBILITY AND CONSTITUTION

Constitution is that aggregate of hereditary characters, influenced more or lessby environment, which determines that individual's reaction successful orunsuccessful, or to the stress of environment.Thus a little reflection will readily convince us that the manifestations of thedifferent and hereditary plan or organizations will be determined by susceptibility. The final product, which we perceived by the attributes in the emotional, intellectual and physical spheres, therefore will be determined by susceptibility. Thus the constitutional type is a good measure of the susceptibility within.

SUSCEPTIBILITY AND DISEASE

Any organism is constantly required to adapt itself to its environmental conditions so that harmony is maintained. Thus, an organism is enable to lead a relatively normal life even in the face of adverse conditions. But there are limits to everything and when then limits of tolerance are reached, the process of adaptation also reach a breaking point. This is made known to the person by a feeling of uneasiness, which though vague, is sufficient enough to warn him that all is not well. Normal susceptibility leads to a state of good health characterized by good nutrition and a healthy outlook on life. Abnormal Susceptibility affects them in the first instance and interfere that the process of adaptation and thereby leads to development of disease. Thus signs and symptoms furnish the only indication of abnormal Susceptibility that exists within and of the disease that result.

Vitholkas, eloquently explains, "Once the basis of the health and healing was understood, Hahnemann applied his genius to the question of disease. In § 11 he writes: "when a person falls ill, it is only this spiritual, self acting (automatic) vitalforce, everywhere present in his organism, that is primarily deranged by the influence upon it of a morbific agent inimical to life".

Here we see clearly Hahnemann went far beyond his time, and was even in advance of us today, in stating that not only the disease but also its cause is dynamic. In other words it is not the microbes or the virus or the bacteria, nor even their virulent poisons on the biochemical level that cause disease, but rather their intimate nature, their vital force, their very 'soul'. And that is something "dynamic". Ortega say's: "Hahnemann, being the genius & visionary in medicine, not only established a method & a precise procedure for investigating and applying remedies for this evil of man; he also penetrated deeply

into the most intimate & essential part of our being, seeking by intuition to find the causes; verifying the condition of that perfectly definable & recognizable causal source of the subjacent evil which is inside us & which constitutes the point of departure or beginning of our destruction. Included in this initiative is the concept of the CAUSE-CAUSORUM. This source or germ of suffering & death is positive, demonstrable, & perfectly recognizable. He called it the MIASM.

Man's natural healing power is undoubtedly undermined, caused to deteriorate, and lessened as a restorative or reconstructive force by the presence of miasmatic condition- a profound and indelible stamp permanently imprinted on the being by repeated perversions, excesses or deficiencies in its functioning. The three miasms when combined, present a picture, which is very difficult to cure. Although one of the three miasms is only very active at one time, yet one cannot expect an easy condition during the hours of dominant miasm. We know that psora is universal and it prepares a ground for the other two. Hence it is difficult to find any individual who is either purely sycotic or syphilitic. The combination can be traced in dropsy, anasarca, the formation of large tumours, and various degenerative organic hypertrophies are the products of mixed miasm.

TARENTULA FAMILY

DOCTRINE OF SIGNATURE OF TARENTULA

1. Tarentuia hispania digs a vertical hole in the ground and covers l with the web so that it resembles the surroundings. Thus it lures its unsuspecting prey. Such Is the intelligence of the spider. Tarentula hispania patients are also extremely intelligent to the extend of being foxy and cunning.
2. The spider waits for its prey quietly and when the prey falls into its trap, it pounces on its prey with a sudden and violent attack and quickly goes back into its hole. This violence is seen in tarantula hispana patients in violent movements like twitching jerking and epilepsy. Tremulous violence in mental sphere also.
3. The spiders are well known for their amatory dance. During mating season the male spider dances a around the female.The female select one and kills and eat others. This violence and destructiveness 's seen in tarantula hispania patients also, They are active quick acting and very angry If contradicted. Very aggressive and progressing to a state of tearing clothes. Destructiveness more when he is being observed.
4. Spiders uses their webs to communicate with each other. A long string connects the legs of spiders. But the spider will not get caught in its own web although the strings are sticky. Here also we can see the cunning destructive nature of spider.

   Tarentuia hispania patients are also very cumnning. They know how to get the things they want. They are great manipulators prone to lying and deception- Kleptomania and feigning sickness. Tarentuia hispania patients will often magnify their symptom for secondary gains.
5. Hurried nature of tarentuta hispania patients are attributed to the hurried activity in the nests or tarantula hispanias, Tarantula hispania patients are compelled to move about constantly. Lower extremities are most restless. Tosses about in bed , when he wakeup bed is in complete disarray. Restlessness with anxiety. Apprehension and feels as if something bad will happen. Hurried and annoyed if people in front of them walk slowly. Walks very fast or will often run out of their restless compulsion. Industrious effective and highly productive in their work. Their hurried nature can be attributed to the poison which hyperacceIe rates their nervous system

6. Tarentula hispania migrate annually through a town named tarentum. Spiders got their names tarentula from this town.

Tarentula Hispanica

- **Hispanic**: digs a vertical hole in the ground and covers it with the web so that it resembles the surroundings luring the unsuspecting prey. Such is the intelligence of this spider. Such patients are extremely intelligent to the extent of being foxy and cunning. It pounces on its prey with a sudden and violent attack and quickly goes back into its hole. This violence is seen in patients with violent movements like twitching jerking and epilepsy. During mating season, after an amatory dance, the female spider selects one male spider for mating and kills others. If she does not get the required space after mating, she kills her mating partner. Such is the destructiveness and aggressiveness of T. hispanica.
- hispanica patients know how to get the things they want. They are great manipulators prone to lying and deception.

Hurried nature of T. hispanica patients is attributed to the hurried activity in the nests & to the poison which accelerate their nervous system. T. hispanica patients are compelled to move about constantly. Lower extremities are most restless. Restlessness with great anxiety & apprehension is present. They are industrious and highly productive in their work.

Sphere of Action: Venom has affinity for motor and sensory functions of nervous system resulting in severe restlessness and uncontrollable agitation. It affects the circulatory system and lymphatic leading to congestion, cellulites and lymphadenitis.

Constitution

It has a nervous and hysterical temperament with tendency to chorea. They are manipulative and cunning. It is suited especially to restless patients, and those who are changeable easily; from happiness to melancholy, from calm and gentile behaviour to violence easily.

Leading indications

- Restlessness, can never sit still. Restless mentality and physically, keeps in constant motion even though motion aggravates.
- Sensitive to music/better by music and rhythm, massaging, dancing and rubbing.
- Chorea and involuntary movements. Constant motion of different parts of body with special affinity to right arm and left leg. Movements stops only during sleep.
- Chilly, yet desire for and relieved in open air
- Aversion to colours red green and black
- Hysterical disposition, feigns sickness when observed, better when alone, sudden changes in mood.
- Complaints recur at the same time or period annually
- Hyperesthesia with sudden attacks of chorea
- Nymphomania, increased sexual desire going to a state of mania

Mind

- Hysteria and foxiness when she finds people observing her she feigns all sort of sickness like fainting and other manipulations. Feigning, demeanour, shy but actually very cunning.
- Destructiveness, insanity
- All complaints are relieved by music.

TARENTULA CUBENSIS

Since Tarentula Cubensis is prepared from a decomposed specimen, it has a pyogenic effect on the body which is the main point of differentiation between T. hispanica & T. cubensis.

Leading indications

- Haemotoxic: acts on blood, indicated for malignant suppurative conditions like carbuncles, felons, abscess and anthrax. Most severe types of inflammations and pains are met with by this remedy
- Periodicity: troubles occur at the same time every year
- Atrocious burning and stinging pains, violent, aggravated at night, patient is forced to get up and walk about
- Bluish purple hue of affected parts
- Early and persistent prostration in septic conditions and diphtheria
- Remedy for pains of death, soothes the last struggle
- Pthisis, especially about the genitals.
- Restless feet
- Intermittent fever aggravated at night with septic chills
- Lt sided chorea
- Whooping cough violence with dryness & hoarseness & and rawness of chest. After paroxysm gets out of breath
- Skin: Malignant suppurative conditions like anthrax and carbuncle. Felons, abscess gangrene etc. Red spots and pimples, bluish purple hue of affected parts. Good for carbuncles with atrocious burning pains. Abscess where pain and inflammation predominates, Scirrhus cancer of breast, senile ulcers.

Modalities: Since, they belong to family of spiders, the modalities are quite common.

- **Aggravations:** Periodicity, touch, cold, noise, damp, evening, hands in cold water, after menses and after coitus
- **Ameliorations:** Riding in a carriage, rubbing, relaxation, sweating, rhythmic music, and open air.

THERAPEUTICS

Homeopathy is one of the most popular holistic systems of medicine. Homeopathic medicines have a proven their efficacy in EPILEPSY . It helps by increasing patient's immune response and improving the overall health. Many medicines are proved in EPILEPSY in homoeopathic system but some important medicines are given below:-

MAT MED DRUGS WITH INDICATIONS ARANEA SCINENCIA

Common name ;- grey spider. They do not spin a web and is found on walls.

Indications –

Constant twitching of lower eyelids Eyes Inflamed, weak, watery and swollen Dull, stupid head ache in the postero nferior part of head, Sleepiness Intolerance of warm weather, all symptoms are <ed in a warm room

ARANEUM TELA

Source ; cobweb of black spider Found in cellars and dark spaces.

Leading indication
Symptoms appear suddenly with cool clammy skin
Disposition to sleep
Lowers the frequency of pulse by acting on arterial system
Numbness m hands and legs <ed by rest
Continued chilliness
Periodical diseases in broken down persons,
Cardiac sleeplessness with increased muscular energy could not be kept in bed- Dances and jumps about the room at night
Dry spasmodic asthma, harassing irritating cough.
Periodic head ache with extreme nervous erythism and obstinate intermittent

LATRODECTUS MACTANS
Picture of angina pectoris accompanied by restlessness and prostration
Chilliness especially icy coldness of extremities
Left sided remedy
Severe prostration but patient cannot lie still due to great restlessness
Constricting and cramping pains Heart

LATERODCCTUS KALIPO
Common name – New Zealand spider
Leading indications
Affected area scarlet red with burning and stinging pains
Lassitude and twitching
Pulse slow scarcely more than 12-14/minute
NERVOUS TWITCHING ALL OVER BODY
Intermittent fever, extremities cold and flaccid with cold clammy skin
Lymphangitis, whole area edematous and swollen

LATRODECTUS HASSELL
Common name – new saith water black spider

Leading indications
Chronic blood poisoning, arrests the intense pain in pyeamia
Great oedema of neighbor hood of wounds with paralysis of lower limbs
Constant delusion of flying
Vertigo with tendency to fall forward
Sever violent burning pains/ malignant conditions with pyeamia. Septic states with pain and sleeplessness.

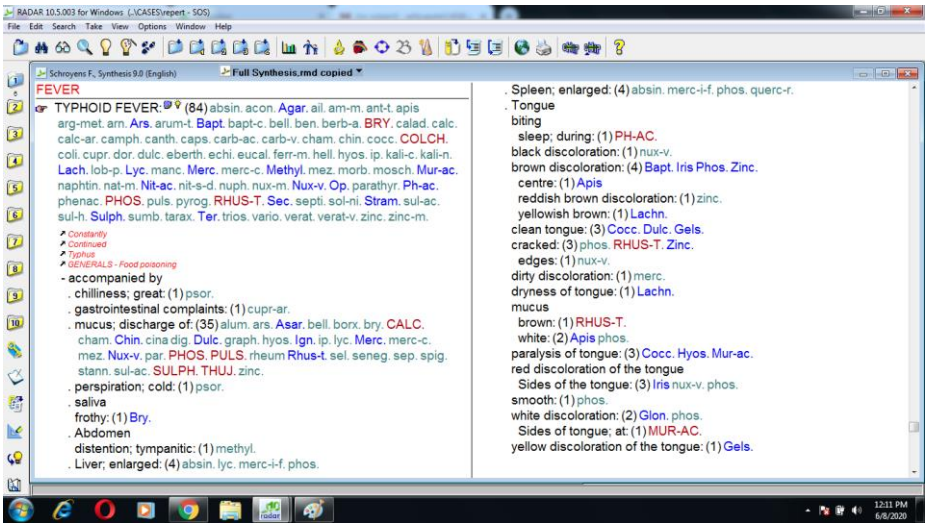
MYGALE LASSIDORA
Common name -Black cuban spider.TINCTURE OF WHOLE SPIDER IS — USED.

Leading indications
Chorea is the most important feature . twitching of facial muscles. Hot flushed face , head jerks to one side. Unsteady gait twitching and jerking of arms and legs. Limbs drag when walking. Words jerked out when an effort is made to speak
Constant motion of whole body , uncontrollable movements of hands and legs usually night
Violent twitching and jerking which stops only during sleep

THERIDION CURASSAVICUM
Common name-orange spider, found in orange tree,

Leading indications
Sensitive to noise , every shrill sound and reverberations penetrates her whole body especially teeth, increases vertigo which then causes nausea
Vertigo with nausea and vomiting on least motion, agg by closing eyes
Inclined to be startled
Time passes too quickly. Desire to occupy himself though he finds peace in nothing.
Aggravation- vibratory motions, w, step and closing eyes
Headache if others walk over the floor, hypersensitive to noise agg from motion
Hysteria, weakness coidness and trembling of whole body
Bites point of tongue during sleep
Constant desire to eat and drink but he does not know what to eat.
Sea sickness of nervous women. They shut their eyes to get rid of the motion of the vessel Traveling and motion sickness
Sensitiveness of spine, hyperasthesia, sits Sideways in a chair toavoid pressure of back of chair against spine.
Pthisis florida – violent stitches high up in the left chest through toback. Oversensitive to all external Impressions esp noise, cracking of paper drives her to despair. Sensitive to light , jar and motion. Sensitive to touch.
Canes and necrosis of bones/ rickets and scrofulous disorders of bones
Pain in left floating ribs, cardiac anxiety and pain.

REPERTORIAL APPROACH
In synthesis repertory-
Repertorium Homoeopathicum Syntheticum is a printed version of RADAR (RAPID AID TO DRUG AIMED RESEARCH).
It was given by Dr. Frederick Schroyens.
Synthesis 9.0/9.1 was published in 2004



In synthesis repertory, under the rubric EPILEPSY 84 medicines is found.

In Murphy's repertory:-

Given by Robin Murphy was published in year 1993(First edition) and 1996 (Second edition) and 2017(Third revised edition)

Acet-ac, achy., acon., aeth., agar., ail., alum., alumn., am-c., ant-c. Ant-t., anthr., apis, arg. BOERICKE REPERTORY

In boericke repertory, under the rubric EPILEPSY 55 medicines is found.

PATIENTS AND METHODS

Study design: The experimental study is made as per the "Randomized controlled clinical trial" method**.**

Study Population:

Study site: G.D. Memorial Homoeopathic Medical College & Hospital, Patna

Study Setting:

- Indoor Patient Department (I.P.D.)
- Outdoor Patient Department (O.P.D.)
- Other sources if possible

Ethical clearance requirement

Itwill be obtained from Ethical committee of the G. D. Memorial Homoeopathic Medical College & Hospital, Patna.

Inclusion criteria

- EPILEPSY coded A01.09 in ICD 10 version 2015 with at least 70% of symptoms.
- Pathological finding with EEG abnormal.
- Study on the EPILEPSY affecting between the age group of 2 to 10 years patients.

Exclusion criteria

- Following patients will not be taken for experiment, as it will affect the perfect outcome of research.
- Patient complicated with other illness including other EPILEPSY, influenza, and other serious diseases.

Sample size Calculation

Minimum 30 patients would be selected starting from 2 to 10 years of age of both sexes. Considering the inclusion criteria mentioned above.

Procedure:

STEP I: Extensive search & study of different books and journals with special reference to Synthesis Repertory.

STEP II: Gather exhaustive information from the Internet according to availability.

STEP III: Selection of 30 patients suffering from EPILEPSY.

STEP IV: Proper case taking will be done according to the standard case-taking Performa.

STEP V: Relevant investigation will be done as per need.

STEP VI: Inclusion and Exclusion Criteria will be fulfilled.

STEP VII: Analysis, Evaluation and Repertorization of the Totality of Symptoms using Synthesis Repertory will be done taking help of Computer- aided (Digital) Repertory.

STEP VIII: Medicine will be selected on the basis of nearest similimum and consultation of materia medica and senior teachers.

STEP IX: Potency, dose and repetition will be strictly arranged following strict Homoeopathic Principle.

STEP X: Follow up of the case at regular interval.

STEP XI: Statistical analysis of the result by using different standard statistical methods (if possible).

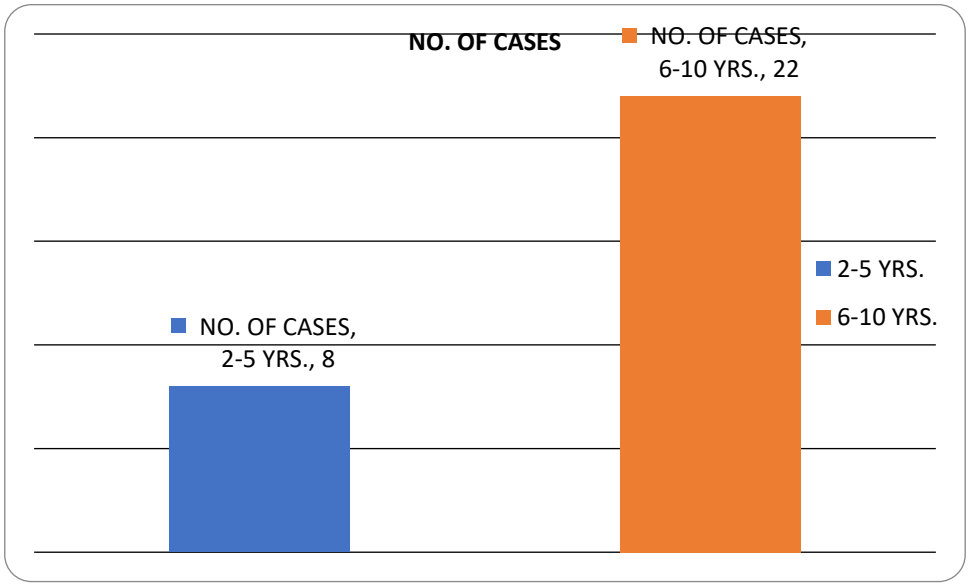
OBSERVATION

Total number of patients included during study of "**A CLINICAL STUDY ON ROLE OF MEDICINES BELONGING TO EPILEPSY FAMILY IN THE CASES OF EPILEPSY**" was 30.Following is the observations noted during the study.

AGE DISTRIBUTION IN THESE CASES

OBSERVATION-1

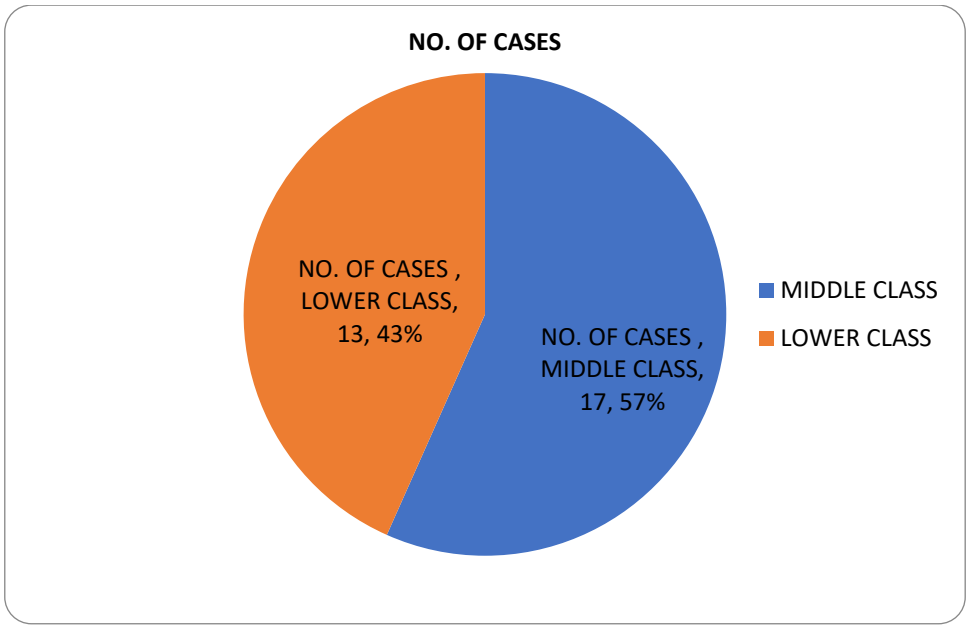
SL. NO.	AGE GROUP	NO. OF CASES	PERCENTAGE
1.	2-5 YRS.	8	26.67%
2.	6-10 YRS.	22	73.33%
TOTAL		30	100%



SOCIO-ECONOMIC STATUS IN THESE CASES

OBSERVATION-2

SL. NO.	SOCIO-ECONOMIC STATUS	NO. OF CASES	PERCENTAGE
1.	MIDDLE CLASS	17	56.67%
2.	LOWER CLASS	13	43.33%
TOTAL		30	100%



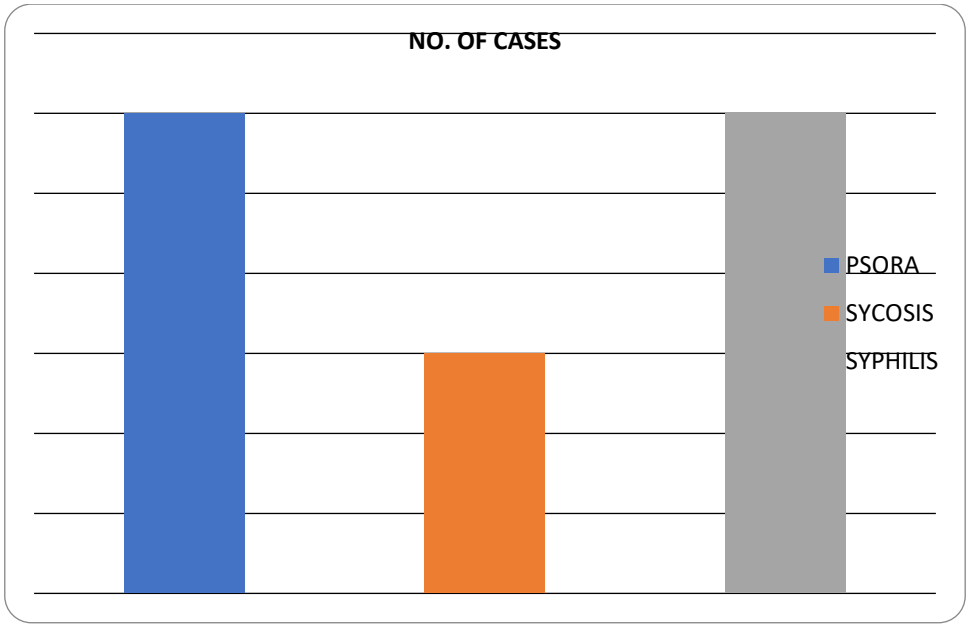
DISTRIBUTION OF HABITATE IN THESE CASES OBSERVATION – 3

SL. NO.	HABITATE	NO. OF CASES	PERCENTAGE
1.	URBAN	02	6.67%
2.	SUB-URBAN	26	86.66%
3.	RURAL	02	6.67%
TOTAL		30	100%

MIASMATIC TENDENCIES IN THESE CASES OBSERVATION – 4

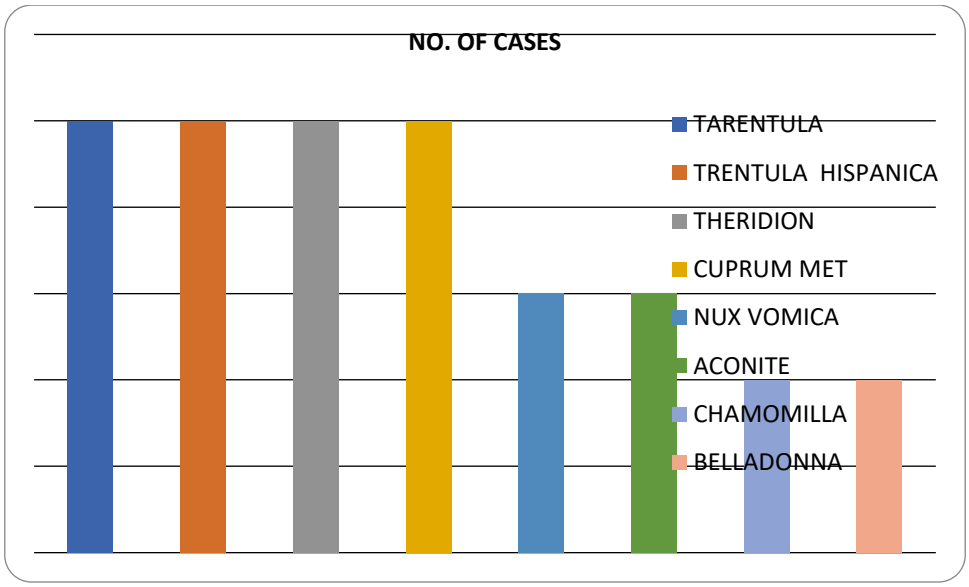
SL. NO.	MIASMETIC PRESENTATION	NO. OF CASES	PERCENTAGE
1.	PSORA	12	40%
2.	SYCOSIS	06	20%

3.	SYPHILIS	12	40%
TOTAL		30	100%



HOMOEOPATHIC REMEDIES USED IN THESE CASES
OBSERVATION - 5

SL. NO.	NAME OF MEDICINE	NO. OF CASES	PERCENTAGE
1.	TARENTULA	5	16.67%
2.	TRENTULA HISPANICA	5	16.67%
3.	THERIDION	5	16.67%
4.	CUPRUM MET	5	16.67%
5.	NUX VOMICA	3	10%
6.	ACONITE	3	10%
7.	CHAMOMILLA	2	6.66%
8.	BELLADONNA	2	6.66%
TOTAL		30	100%

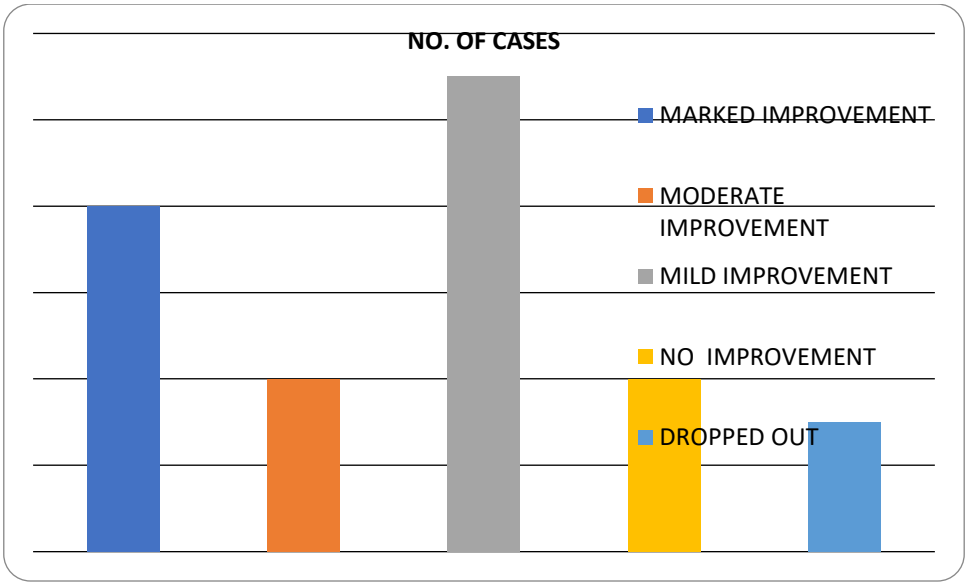


POTENCY USED IN THE CASES
OBSERVATION – 6

SL. NO.	POTENCY USED	NO. OF CASES	PERCENTAGE
1.	1M	2	6.67%
2.	30C	18	60%
3.	200C	10	33.33%
TOTAL		30	100%

RESULT OF HOMOEOPATHIC TREATMENT IN THESE CASES
OBSERVATION-7

SL.NO.	TREATMENT RESULT	NO. OF CASES	PERCENTAGE
1.	MARKED IMPROVEMENT	08	26.67%
2.	MODERATE IMPROVEMENT	04	13.33%
3.	MILD IMPROVEMENT	11	36.67%
4.	NO IMPROVEMENT	04	13.33%
5.	DROPPED OUT	03	10%
TOTAL		30	100%



In my study, Total 30 (100%) cases, 26.67% cases were marked improved, 13.33% cases were moderate improved, 36.67% cases were mild improved, 13.33% cases were no improved and 10% cases were dropped out.

STATISTICAL ANALYSIS OF THE DATA

Chi square test was performed to test the role of medicine belonging to spider groupin the cases of EPILEPSY. Among the five categories of assessment criteria i.e. marked improvement, moderate improvement and mild improvement were taken as positive response or effective and no improvement as well as dropped out was considered as negative response.

Ho: There is no difference in the treatment of EPILEPSY at (5 %) level of significance.

H1: The cure rate of the patient by EPILEPSY at (5%) level of significance.

RESULT OF THE PATIENT

Result	Number of cases	Percentage
Marked Improvement	08	26.67%
Moderate Improvement	04	13.33%
Mild Improvement	11	36.67%
No Improvement	04	13.33%
Dropped Out	03	10%
Total	30	100%

CHI-SQUARE TEST

	CURED (MARKED IMPROVEMENT & IMPROVEMENT)	**NOT CURED (NO IMPROVEMENT & DROPPED OUT)**	**TOTAL**
EXPERMENTAL CASES (MEDICINE)	**20** **E1=19.17**	**O = 5** **E2 = 5.83**	**25**

CONTROL CASES (PLACEBO)	**O = 3 E3 = 3.83**	**O = 2 E4 = 1.17**	**5**
TOTAL	**23**	**7**	**30**

1) DEGREE OF FREEDOM(DF)

DF=(R-1)(C-1) (R = Row, C = Column)

Total calculated value of Row (R)= 2-1=1

Total calculated value Column(C)= 2-1=1

DF=1*1=1

2)**PROBABILITY OF OUTCOME =1/1 = 1**

2) EXPECTED VALUE(E) =

E1= 25*23/30=19.17 (rounded off to two decimals)

E2=25*7/30= 5.83

E3=5*23/30=3.83

E4=5*7/30=1.17 (rounded off to two decimals)

The formula used for the calculation of Expected frequency is:

Row Total*Column Total/Grand Total

Total calculation of E1+E2+E3+E4=30

3) CALCULATION=

O	**E**	**O-E**	**$(O-E)^2$**	**$(O-E)^2 / E$**
20	**19.17**	**0.83**	**0.69**	**0.035**
5	**5.83**	**-0.83**	**0.69**	**0.118**
3	**3.83**	**-0.83**	**0.69**	**0.180**
2	**1.17**	**0.83**	**0.69**	**0.589**

$\chi^2 = \sum (O-E)^2 / E$

$= \sum (20-19.17)^2 / 19.17+(5-5.83)^2 / 5.83+(3-3.83)^2 / 3.83+(2-1.17)^2 / 1.17$

$= \sum (0.035+0.118+0.180+0.589)$

= 0.922 (calculated value)

Value of $\chi^2$from Table for DF = 1 is 3.84

CRITICAL VALUES												
	p value											
DF	**0.25**	**0.20**	**0.15**	**0.10**	**0.05**	**0.025**	**0.02**	**0.01**	**0.005**	**0.0025**	**0.001**	**0.0005**
1	1.32	1.64	2.07	2.71	**3.84**	5.02	5.41	6.63	7.88	9.14	10.83	12.12
2	2.77	3.22	3.79	4.61	5.99	7.38	7.82	9.21	10.60	11.98	13.82	15.20
3	4.11	4.64	5.32	6.25	7.81	9.35	9.84	11.34	12.84	14.32	16.27	17.73
4	5.39	5.59	6.74	7.78	9.49	11.14	11.67	13.23	14.86	16.42	18.47	20.00

5	6.63	7.29	8.12	9.24	11.07	12.83	13.33	15.09	16.75	18.39	20.51	22.11
6	7.84	8.56	9.45	10.64	12.53	14.45	15.03	16.81	13.55	20.25	22.46	24.10
7	9.04	5.80	10.75	12.02	14.07	16.01	16.62	18.48	20.28	22.04	24.32	26.02

Thus, with DF 1 and critical value 0.05 comes out as 3.84, but calculated value is 0.922which is less than 3.84.

Thus –

Calculated value < Critical value

0.922 < 3.84

- **NH is accepted.**
- **AH is rejected.**

- This implies that the values are independent

NULL HYPOTHESIS: EPILEPSY is not fully treated by homoeopathic medicine belonging to tarentula family.

DISCUSSION

The study under discussion was undertaken to show the efficacy of homoeopathic medicines in the treatment of EPILEPSY. The dissertation work is entitled **-"A CLINICAL STUDY ON ROLE OF MEDICINES BELONGING TO SPIDER GROUP IN THE CASES OF EPILEPSY"**, which was in accordance with the objectives of the study. The study encompassed patients from different age groups and socio-economic status. Randomized controlled trail study design was adopted to show the treatment of EPILEPSY.

The prevalence use of homoeopathic medicines, according to age, was found that 2-5 yrs. were 26.67% and 6-10 yrs. were 73.33% respectively.

The prevalence use of homoeopathic medicines, in accordance to income group, 6.67% Urban was found, 86.66% sub urban was found and rural was found 6.67%.

In the first case of Master RAGHAV KUMAR, he was suffering from high grade EPILEPSY with pain in the bodyache since last 15 days with appetite decreased associated with weakness since last 5 days. Symptoms aggravated after taking food. Analysis of case according to totality of symptoms, tarantula 30 was prescribed which improved his condition.

Similarly in the third case of MASTER KUNAL KUMAR, the patient was suffering from He was suffering from EPILEPSY since last 10 days with bodyache since last 7 days. Analysis of case according to totality of symptoms, Tarentula hispanica1M was prescribed which improved his condition.

The gradation of the outcome measures were checked out as marked improvement, moderate improvement, mild improvement, no improvement and dropped out.

Among the 30 cases that were given homoeopathic medicines, 8 were marked improved, 4 were moderate improved, 11 were mildly improved, 4 were no improvement, and 3 were dropped out.

So from the Total 30 (100%) cases, 26.67% cases were marked improved, 13.33% cases were moderate improved, 36.67% cases were mild improved, 13.33% cases were no improved and 10% cases were dropped out.

So from out of 30 cases 23 cases i.e. 77% were success and 7cases i.e. 23% were failure. So, from the above study, we see that the physiological action of tarentula in case of EPILEPSY presenting with twitchig in whole body is effective.

SUMMARY

My dissertation is on the **"A CLINICAL STUDY ON ROLE OF MEDICINES BELONGING TO SPIDER GROUP IN THE CASES OF EPILEPSY"**. Cases selected for the dissertation work were chosen with the help of my guides and senior faculty of my college. It was a fact to experience, that following the concept of the totality of the symptoms, could only bring out a meaningful result as far as patient is concerned.

The cases that have been observed in this dissertation follow the strict principals of Homoeopathy and analysis has been done using Synthesis Repertory in software format from RADAR 10.5.003.

I also experienced, that there are various aggravating factors like some, contaminated food and contaminated water intake, uncooked meat which need to be taken care of. This is because a factors, also from an important constituent of the causations, and proper evaluation needs to be done in this respect. Here the role of our medicine comes into play and it is seen that these cases respond well to homoeopathic medicines. Findings emphasize the need for life-course approach in prevention and management and also the need for focused and targeted programs. The increasing burden of epilepsy in India in coming years due to sociodemographic and epidemiological transition warrants public health community to give priority for this eminently preventable and manageable condition in healthcare delivery. However, a proper understanding of the epidemiology of epilepsy is required to discern and delineate factors that are of relevance (that can be modified) in prevention, management, and rehabilitation. Future studies need to move to nationally representative populations using well-defined methodologies for developing a strong public health response for prevention and control of epilepsy in India.

In my clinical study, it has been observed that the efficacy of homoeopathic medicinesbelonging to spider group in the cases of spider is very good, out of 30 cases cure rate could be achieved in 23 cases. Hence 77% cure effectiveness was achieved with homoeopathic medicines. 4 cases were not improved and 3 cases were dropped out. So I considered 23% cases as failure. This study has shown that the role of homoeopathic medicine belonging to spider group in the cases of spider group is very effective.

Role of Homoeopathic Drugs in the Cases of Uterine Fibroids with Repertorial Analysis

Dr.Brijesh Kumar Tiwari[1] , Dr.Vineeta Neeraj Kumar[2]
[1]*Assistant Professor, Department of Physiology and Biochemistry, G D Memorial Homoeopathic Medical College, Amar road east ramkrishna nagar, Patna, Bihar, 800027*
[2]*Assistant Professor, Department of Surgery, Aarihant, Homoeopathic Medical College & Research Institute, Swarnim Startup And Innovation University, Bhoyan Rathod, Near ONGC WSS, Adalaj, Kalol Highway, Gandhinagar, Gujarat-382420*

Abstract- Homeopathy is becoming increasingly popular in whole of the world. Now it is time to prove to the world what homeopathy can offer in surgical diseases. Homeopathic medicines cannot take the place of surgery but can be of great help to the patients, which do not want to go for surgery or cannot be operated upon due to various medical reasons. It is also ideal for underdeveloped and developing countries where financial factor play a major role in deciding the options for treatment. Homeopathic treatment for uterine fibroids can be very efficient and, in many cases, may be the only treatment you will ever need to get healthy again. The patients were assessed on the basis changes in the symptoms during the period of few weeks. In homoeopathic treatment we must observe symptoms of patients. There are some common symptoms of Fibroid:

- **Heavy uterine bleeding.**
- **Prolonged uterine bleeding during menstruation.**
- **Miscarriage**
- **Frequent or irregular periods.**
- **Frequent urination**
- **Pain during intercourse**
- **Backache**
- **Constipation**
- **Non cyclic pelvic pain.**
- **Cramps during menstrual periods.**
- **Weight gain.**

Keywords-Homoeopathy, uterine fibroid, myomas, true surgical diseases, similimum

INTRODUCTION

Uterine fibroids are benign tumors that originate in the uterus (womb). Although they are composed of the same smooth muscle fibers as the uterine wall (myometrium), they are much denser than normal myometrium. Uterine fibroids are usually round.

Types of Fibroids:
1.Intramural fibroids, the most common, grow in the wall of the uterus.
2.Sub serosal fibroids grow on the outside of the uterus. As they grow larger, they can cause pain due to their size or pressure put on nearby organs.
3.Submucosal fibroids grow just underneath the uterine lining and can crowd into the uterus cavity and lead to heavy bleeding and other more serious complications.
4.Pedunculated fibroids grow on small stalks inside or outside the uterus.

AIM AND OBJECTIVES

1.To ascertain the efficacy of homoeopathic medicines in the treatment of the case of UTERINE FIBROID.
2.To assess the utility of repertory in the treatment of the case of UTERINE FIBROID.
3.To establish the miasmatic influence in the case of UTERINE FIBROID.
4.Top used Homeopathy medicine for Fibroid Treatment

- Ammonium Carbonicum: It is another homeopathic medicine used for controlling fibroid problem. When blood looks black in color, clotted and extremely profuse during menstrual time at that time this medicine works as a wonder spell. This medicine also works effective for treating extreme pain in thighs during menorrhagia.
- Kali Carbonicum: Kali Carbonicum is best relief in case when bleeding from uterus continues for too long period and when it causes back pain.
- Ferrum Metallicum: Ferrum Metallicum is one such medicine, which is use for controlling excessive bleeding from uterus due to fibroid. This medicine has shown its best result in case

when there is excessive blood of pale and watery character flow from uterus.

- Ipecacuanha: It is another homeopathic remedy work effectively in case of fibroids for treating menorrhagia cases.
- Cinchona Officinalis and Ferrum Phosphoricum: Both Cinchona officinalis and Ferrum phosphoricum are excellent homeopathic medicines for curing fibroid in patients with anemia. It helps in improving the hemoglobin count in women who are suffering from fibroid. This medicine is a wonder spell for those women whose hemoglobin count have excessively went down due to extreme loss of blood and anemia.
- China Officinalis and Ferrum Met: Both are two well recognized Homeopathic medicines for successfully treating uterine fibroids where symptoms include heavy bleeding and Thalapsi Bursa Pastoris – Effective Homeopathic medicine for uterine fibroids with prolonged menses. Thalapsi Bursa is one of the top-grade Homeopathic medicines for treating uterine fibroids with prolonged menses. The menses continue for 10-15 days. Manses appear very frequently as well. The next menstrual cycle appears even before recovery from the periods has occurred. Menstrual bleeding is profuse, with the presence of large clots. Violent uterine colic during menses may also arise. Cramping pain in the uterus during menstruation in uterine fibroids cases is also suggestive of use of Thalapsi Bursa Pastoris.
- Calcarea Carb: Useful Homeopathic medicine for treating heavy periods from uterine fibroids. Calcarea Carb is a very useful Homeopathic medicine for treating heavy periods from uterine fibroids. Manses continue for long and may even appear early. Vertigo during menses may arise. Leucorrhea of thick, milky or yellow color is another complaint that may attend.
- Belladonna and Sepia Officinalis: Best Homeopathic medicines for uterine fibroids where menses are painful. Belladonna and Sepia Officinalis are well indicated Homeopathic medicines for uterine fibroids where the menses are painful. Belladonna is best prescribed where there is cramping pain in the uterus during menses, the menses are bright red in color and profuse. Use of Sepia Officinalis is recommended in case of griping, burning or bearing down pains during menses. menses start early and are quite copious. Fainting and chilliness during menses may attend. Homeopathic medicine Sepia Officinalis is also indicated for treating painful intercourse in uterine fibroids cases.
- Ustilago Maydis: Suitable Homeopathic medicine for uterine fibroids with dark menstrual bleeding. Ustilago Maydis is a highly suitable Homeopathic medicine for uterine fibroids where menstrual bleeding is dark. Clots may also be present in menstrual blood. Uterine bleeding may be stringy in nature.
- Sabina Officinalis: Homeopathic medicine for uterine fibroids where clots pass with menstrual blood. In case of menstrual bleeding with clots in uterine fibroid cases, Sabina Officinalis is a significant Homeopathic medicine. The slightest motion increases menstrual bleeding. Pain from sacrum to pubis is another attending feature. During menses, pain in uterus may be present that gets better by lying on the back. Uterine pain may extend to the thighs. Other symptoms include foul, acrid, corrosive, yellow leucorrhea.
- Fraxinus Americana: Excellent Homeopathic medicine for uterine fibroids with bearing down sensation. Fraxinus Americana is a top-grade Homeopathic medicine for uterine fibroids which is mostly recommended when the major indicating feature is a bearing down sensation in the pelvis from uterine fibroid.
- Thuja Occidentalis: Thuja is also excellent for treating pressure symptoms of urinary bladder by the fibroid, the patient complaint of difficulty in empty the whole bladder at one time. Patient having heavy metrorrhagia with heavy anemia.
- Trillium Pendulum and Kali Carbonicum: Wonderful Homeopathic medicine for uterine fibroids with back pain during menses. In uterine fibroid cases with back pain during the menstrual cycle, Homeopathic medicine Trillium Pendulum comes highly recommended. The pain may radiate to the hips from the back during menses. Tight binding of the back and hips provides relief. Menstrual bleeding is bright red and gushing. The slightest movement worsens uterine bleeding. Trillium Pendulum is also indicated for inter-menstrual bleeding every two weeks. Another attending feature is faintness from uterine bleeding. Homeopathic medicine Kali Carbonicum is

selected when there is violent back pain during menses. The pain gets better from sitting and pressure. The menstrual flow is also copious.

- Erigeron Canadensis: Homeopathic medicine for frequent urination in case of uterine fibroids.
- Sabina: Homeopathic Medicine for Uterine Fibroids causing labour-like pains in groin area, Sabina is the next significant Homeopathic medicine on the list for Fibroids in uterus. The key symptom for Sabina use is profuse, partly fluid and partly clotted menstrual bleeding. Based on this specific symptom I have found numerous Fibroids cases recovering wonderfully well under prescription of Sabina. Other symptoms are gushing uterine bleeding, increase of bleeding from slight motion and offensiveness in blood. Another characteristic symptom is pain from sacrum (small of back) to pubes during periods. Labour-like pains may also be present in sacrum and groin region during menses.
- Phosphorus, Lachesis and Ustilago: Top Rated Homeopathic Medicines for Uterine Fibroids, Homeopathic medicines Phosphorus, Lachesis and Ustilago are also know natural cures of Uterine Fibroids. The character of blood during the menstrual cycles decides which of the three to prescribe.

MATERIAL & METHODOLOGY

Material

1.Project site - Proposed study was undertaken at OPD/IPD/ Peripheral OPD of Sagar Homoeopathic Medical college Sagar.

2.Number of cases - 05 cases were included in the study.

3.Duration of study - The study was undertaken for a period of 12 months.

4.Procuring of medicine - Medicine were dispensed from the dispensing unit of Sagar Homoeopathic Medical College Sagar (M.P.)

Methodology:

1.Selection of cases: Selection of cases was done by random sampling method.

2.Inclusion criteria: Diagnosed/undiagnosed cases of Uterine Fibroid were included, irrespective of their age, caste, religion & duration of illness.

3.Exclusion Criteria: The cases without proper follow up were excluded from the study.

4.Diagnostic Criteria: The detailed case taking & clinical examination was carried out to clinch the diagnosis were advised as and when found necessary.

5.Case taking proforma: A case taking proforma was especially designed for the study with the approval of the guide.

6.Case taking: Detailed case taking has been done following Homoeopathic principles.

7.Analysis & Evaluation: Analysis & Evaluation of the symptoms was done according to the Homoeopathic principles.

8.Repertorization: Repertorization was done by using the repertory according to nature of the case.

9.Selection of Medicine: Selection of the medicine was done on the basis of Repertorial Analysis and Concept of totality.

10.Selection of Dose & Potency: Selection of dose & potency was done following Homoeopathic principles.

11.Follow up: Follow-up the cases were done till the establishments of cure.

12.Record: The patient's records were maintained to draw the conclusion.

13.Results: Following parameters were fixed according to the type of the response obtained after the treatment.

- Cure: Feeling of mental & Physical well-being with disappearance of all signs & symptoms for which patient initially approached, without any relapse.
- Improvement: Feeling of mental and physical well-being with relief in all signs and symptoms for which the patient initially approached.
- Status quo: No change in any complaint of the patient in spite of taking the medicine for a period of time.
- Worse: When there is increase in the symptoms, sign and disease continues with its pace and patient gets worse with passage of time.

DISCUSSION, SUMMARY AND CONCLUSION

The study "Role of homoeopathic in the cases of uterine fibroid with repertorial analysis" was undertaken keeping in view of the gravity, incidence, morbidity and probable solutions to counter this clinical experience. Present study was undertaken to assess the clinical sign and symptoms. After careful repertorization homoeopathic medicine was prescribed on the basis of on totality of symptomatic medicine which was prescribed on the basis of totality of symptoms. The study was limited to 10 patients, the selection of whom was based over the criteria fixed at the outset. The cases were diagnosed clinically as having Elephantiasis. and were randomly selected from the outpatient department of repertory, Sagar Homoeopathic Medical College, Sagar (M.P.) Clinical experience in case of Elephantiasis.

Age: The incidence increases above the age of 20 to 50 presentation is usually in the 50s.
Sex: Female.
Weight: This is more common in fatty female.
Geographically: Uterine fibroid is present uniformly all over the world.
Diet: No specific.
Drugs: Immunosuppressive drug and hormonal drugs cause higher incidence of uterine fibroid.
Locations: In uterus.
Character of uterine fibroid:
The first symptom is usually fever irregular and painful menstrual period and abdominal pain.
Back pain.
Frequency in urinating.
Constipation and distended abdomen.

Miasm
Elephantiasis cover Sycotic Miasm and psoric background.
Indicated Medicine: The treatment of uterine fibroid was based on totality of symptoms according to which Silicea, thuja carb belladonna sepia Phos. & proved to be the most effective medicine.
Potency: The maximum effective potency is 30,200.
Result: In this study of 05 Cases 1 cases are Improved and 5 is cured.

Summary: The study "Role of homoeopathic drugs in cases of the uterine fibroid with repertorial analysis'' was undertaking with following objects to ascertation the efficacy of homoeopathic medicines in the treatment of the case of Uterine fibroid, to assess the utility of repertory in the treatment of the case of uterine fibroid., To establish the miasmatic influence in the case of Uterine fibroid., To establish the repertorial construction in the case of uterine fibroid. The study was undertaken for a period of one year in O.P.D./I.P. D of Sagar Homoeopathic Medical College Hospital & Research Center, Sagar (M.P.), 10 Cases of Uterine fibroids were selected for study. The case history was taking on a proforma specially prepared for the study. Presenting symptoms and clinical examination were carried out to diagnosis the patient suffering from Uterine fibroid. After detailed case taking, repertorization by done using Kent's repertory. Medicines were prescribed on the basis of repertorial analysis and concept of totality of medicine and were dispensed from hospital dispensary. Follow up of the cases were taken periodically as per gravity of disease ranging from 1 to 2 months. following salient

features have evolved from the study: It is specially in Female at the age between 20 to 50 years. The great majority of cases occur in Low socio economic persons. The uterine fibroid more comment in fatty female. Most commonly found in the age of 50 year. The Uterine fibroid have covered the Sycotic miasm. The effective remedy is Silicea, thuja, calcarea carb, Phosphorus, belladonna, sepia. The maximum effective potency is 30 and 200. A thorough study of 10 cases was done in 12 months duration, where each case was studied on the basis of totality of symptoms in an unbiased manner. This establishes the superiority of homoeopathic system of treatment in cases of Uterine fibroid.

A STUDY IN PATIENTS OF LAPAROSCOPIC MEDIAN ARCUATE LIGAMENT RELEASE

Dr.Vineeta Neeraj Kumar
BHMS,MD(Hom), DNHE
Assistant Professor, Department of Surgery, Aarihant
Homoeopathic Medical College & Research Institute, Swarnim Startup
And Innovation University, Bhoyan Rathod, Near ONGC WSS, Adalaj
Kalol Highway, Gandhinagar, Gujarat-382420
EMAIL- Vineeta.nkumar@gmail.com

AIM- To study pre-operative and post-operative management of patients of laparoscopic median arcuate ligament release

METHOD- A study of 10 patients presented in surgical OPD of tertiary care hospital of radiologically proven median arcuate ligament syndrome over a period of 12 months. Patients requiring surgery were selected for the study. All the patients underwent laparoscopic Median arcuate ligament release. Post-operatively celiac artery doppler was done in all the patients. Asymptomatic patients and those undergoing open surgery for median arcuate ligament release were excluded from the study.

RESULTS- Median arcuate ligament syndrome presents most commonly between 3rd and 5th decades with male preponderance. Commonly presenting with epigastric pain or postprandial fullness. Radiological investigations are pivotal in the diagnosis and postoperative assessment. Laparoscopic median arcuate ligament release is an extremely effective surgery having substantial reduction in symptoms post operatively.

CONCLUSION- Laparoscopic release of median arcuate ligament was found to be effective in substantially reducing the symptoms most commonly chronic abdominal pain ofthe patients of median arcuate ligament syndrome with short post-operative stay. Radiological investigations prove useful in diagnosis and post-operative evaluation. Early surgical intervention significantly improves the symptoms and prevents future complications including intestinal ischemia and need for emergency laparotomy surgeries. There is significant improvement in post operative blood flow based on post-operative investigations such as celiac artery doppler studies done on post operative day 1.

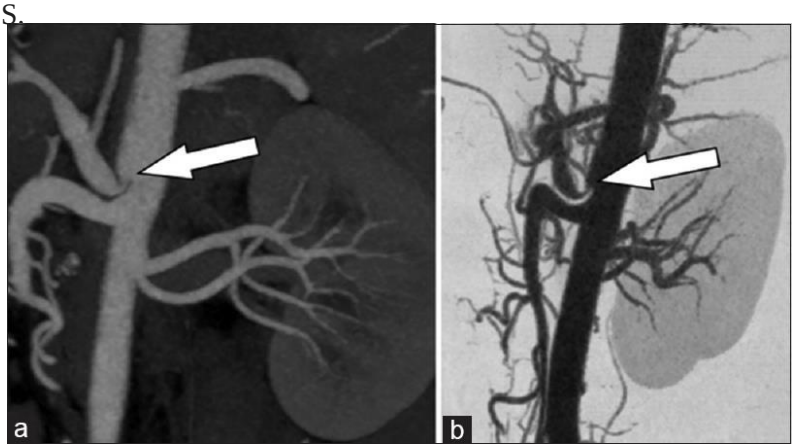
KEYWORDS-
Median arcuate ligament syndrome, Laparoscopic release of median arcuate ligament,Chronic abdominal pain

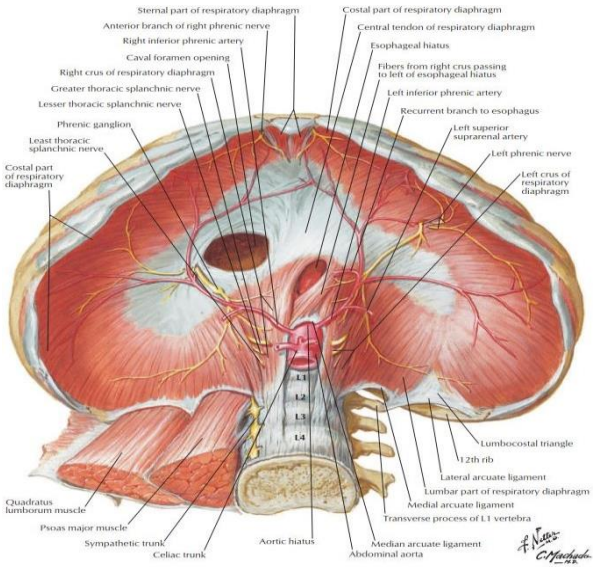
INTRODUCTION-

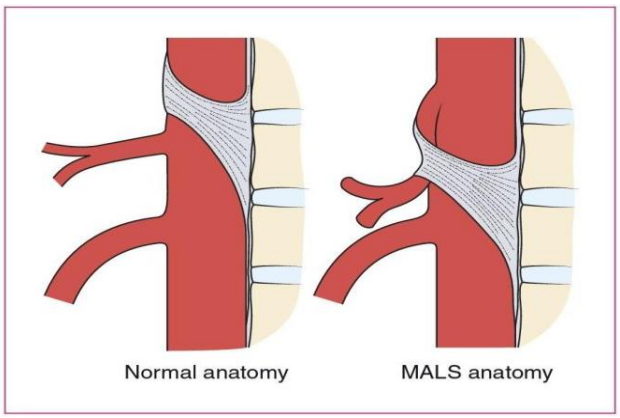
Median arcuate ligament syndrome (MALS) or Dunbar syndrome is a rare clinical disease and diagnosis of exclusion characterized by compression of celiac trunk by median arcuate ligament, prominent fibrous bands.

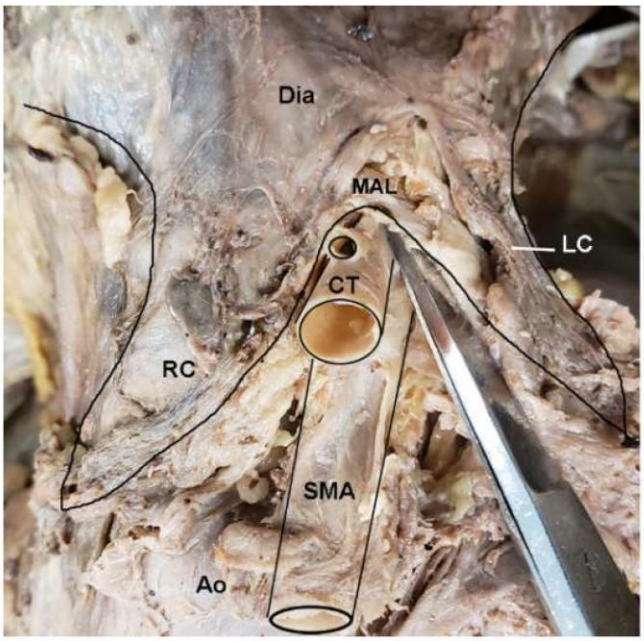
Median arcuate ligament forms the fibrous arch forming a junction between right and left crura of diaphragm. It forms the antero-superior boundary of aortic hiatus at the level of 1st lumbar vertebra just above the origin of celiac artery. There may be low riding of the fibrous attachment of or the diaphragmatic cruras themselves may lie lower down covering the celiac artery causing its compression. Alternatively celiac artery may have a higher origin leading to similar picture. External compression on celiac artery by median arcuate ligament leads to triad of symptoms whichincludes postprandial epigastric pain, vomiting and weight loss. Presenting clinical symptoms are various gastrointestinal symptoms like chronic postprandial epigastric pain, nausea, vomiting, abdominal fullness, weight loss, anorexia, sometimes, abdominal pain during body exercise caused by an intermittent visceral ischemia. It may cause foregut ischemia due to inadequate collateralsor mid gut ischemia due to diversion of blood to foregut. Besides the extrinsic vascular compression, Median arcuate ligament syndrome has a multifactorial etiology and it has been suggested as a neurogenic disease resulting in altered sensation and pain from the somatic nerves in the splanchnic plexus.

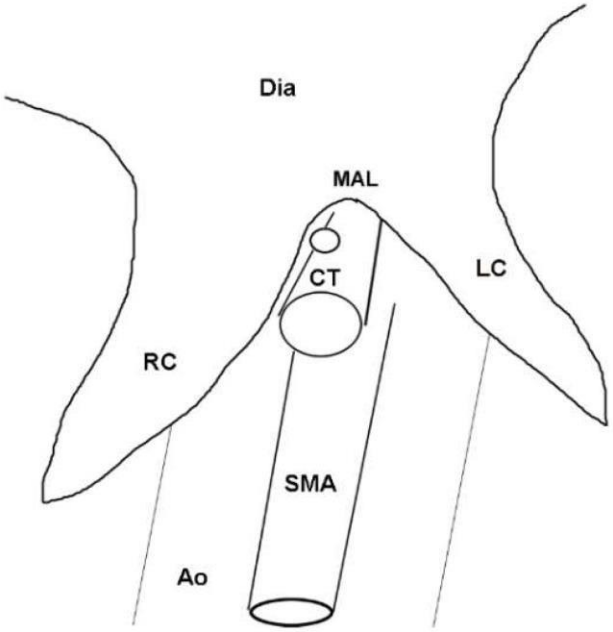
MALS is ordinarily diagnosed after the exclusion of other more common conditions; however, variety of imaging and diagnostic modes, including Duplex ultrasonography, contrast enhanced computed tomography, CT angiography, MR angiography, gastric tonometry and angiography can suggest findings consistent with MALS.











Degree of external compression can be estimated with help of percentage of stenosis seen in angiogram

Treatment options include release of median arcuate ligament (open, laparoscopic or robot-assisted)and open vascular reconstruction. Laparoscopic approach for the correction of MALS is consideredto be feasible and safe.

Key operative steps of Laparoscopic Median Arcuate Ligament Release,

-Left lobe of liver is retracted using bowel grasper and stomach retracted using Babcock's forceps.

-Lesser omentum is divided along the lesser curvature to enter lesser sac.

-Esophagus identified, dissected and umbilical tape is used to retract esophagus

-Right and left crura of diaphragm are dissected till Aorta is visualized.

-Dissection done and aorta is traced in above downward direction till origin of celiac trunk isreached.

-Fibers of median arcuate ligament around celiac artery are dissected until no external compressionis present over celiac artery

On intraoperative exploration, the celiac artery was found to be encased and partially compressed by fibrotic tissue in each patient. In each case laparoscopic excision of fibrotic tissue, celiac plexus and ligament division was performed. Intra-operative doppler can be performed to evaluate real- time change in compression and dissection can be continued till adequate reversal of compression is achieved.

MATERIALS AND METHODS- A study of 10 patients presented in surgical OPD of tertiary care hospital of radiologically proven median arcuate ligament syndrome over a period of 12 months. Patients requiring surgery were selected for the study. All the patients underwent laparoscopic Median arcuate ligament release. Post-operative celiac artery doppler was done onpost operative day 1 in all the patients.

INCLUSION CRITERIA-

1. All patients with Median arcuate ligament syndrome (MALS) and radiologically confirmed external compression of celiac artery by medial arcuate ligament and underwent laparoscopic median arcuate ligament release.

EXCLUSION CRITERIA-

1. All patients with incidental radiological finding of celiac trunk compression but asymptomatic.
2. All patients who underwent surgery through open approach.

RESULT-

1. Age distribution

In our study, it was observed that 4 out of 10 patients that suffered from MALS were of 31-40 yearsof age (40%) followed by the age group of 41-50 years (30%). It was observed that younger and older spectrums of the age group were less frequently found to be suffering from MALS.

2. Gender distribution

In our In our study, MALS was observed to have male preponderance with 8 out of 10 patients (80%) being male and only 2 of the 10 patients were females.

3. Chief complaint

Complaints	**No. of patients**	**Percentage**
Epigastric pain	3	30%
Postprandial fullness	3	30%
Weight loss	1	10%
Vomiting	2	20%
Anorexia	1	10%

In our study 5 presenting complaints were observed of which 3 out of 10 patients presented with epigastric pain (30%) or postprandial fullness (30%) as presenting complaint. Weight loss and anorexia were found least commonly (10%) as the chief complaint although these were frequently found as associated complaints with either epigastric pain or postprandial fullness. 2 out of 10 patients (20%) presented with complaint of non-bilious, non-projectile vomiting containing food particles.

4. Radiological investigations

Percentage of compression on angiogram (%)	No. of patients	Percentage
20 to 30%	2	20%
30 to 40%	3	30%

40 to 50%	3	30%
50 to 60%	1	10%
60 to70%	1	10%

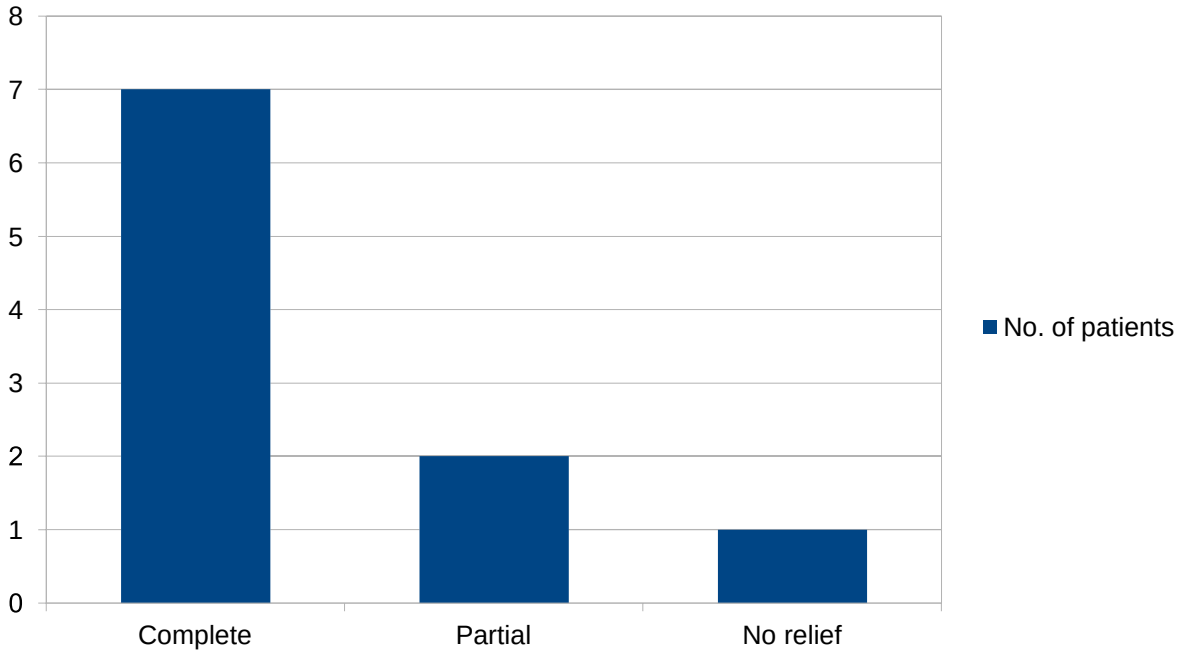
Angiogram is considered as an important tool in assessing the severity of the disease and subsequently predicting the chances of complications and prognosis post operatively. In our study itwas observed that 3 out of 10 patients had 30-40% compression of the celiac artery and other 3 out of 10 patients had 40-50% compression thus 60% of the patients had 30-50% compression and 80%patients had less than 50% compression.

5. Examination

Finding	No. of Patients	Percentage
Abdominal bruit	4	40%
Abdominal tenderness	1	10%
Abdominal Distension	2	20%
No positive findings on examination	3	30%

In our study, on examining the patients of MALS auscultatory abdominal bruit was most commonlyobserved finding present in 4 out of 10 patients (40%) and in 3 out of 10 patients (30%) patients the examination revealed no abnormalities. Abdomen was found to be distended in 2 out of the 10 patients (20%) and 1 patient (10%) had abdominal tenderness.

6. Post-operative relief of symptoms



In our study, it was observed that complete relief from symptoms could be achieved in 7 out of 10 patients(70%) and no relief in just 1 out of 10 patients(10%). 2 out of 10 patients(20%) had partial relief from the symptoms. Overall, 90% of the patients showed improvement from their pre- operative state after laparoscopic release of median arcuate ligament.

7. Post operative celiac artery re-establishment of blood flow

Re-establishment of bloodflow	No. of patients	Percentage
Complete	10	100%
Partial	0	0%
None	0	0%

Celiac artery doppler is done on post operative day 1 to evaluate the adequacy of the laparoscopic median arcuate ligament release. In our study all 10 patients (100%) achieved complete re- establishment of blood flow on post operative celiac artery doppler study.

SUMMARY

In our study, these are the findings that we have summarized,

- Majority of patients presented in 3rd-5th decade of life with a mean age of 34.6 years
- Male preponderance (80%) was noticed in cases of medial arcuate ligament syndrome.
- Epigastric pain (30%) and Postprandial fullness (30%) are the most common chief complaintin our study

followed by vomiting (20%). The other symptoms that we noticed in our study was anorexia (10%), weight loss (10%).

- Mean percentage of celiac artery compression in the patients was 35.5%
- On examination, abdominal bruit was most commonly observed finding present in 40% patients and in 30% patients the examination revealed no abnormalities. Abdomen was foundto be distended in 20% patients and 10% patients had abdominal tenderness.
- Complete reversal of symptoms could be achieved in 70% of patients and partial relief in 20% of patients. 1 patient in the study continued to have postprandial pain after undergoing laparoscopic median arcuate ligament release.
- Celiac artery doppler was done on post operative day 1 and 10 out of 10 patients (100%) achieved complete re-establishment of blood flow marking adequate release of median arcuate ligament.

RESULT

- We successfully treated 9 out of 10 patients through laparoscopic median arcuate ligamentrelease.
- 1 patient continued to have symptoms despite the surgery and will need further work-up forthe cause of symptoms.
- Post-operative celiac artery doppler done on post operative day 1 showed complete re-establishment of blood flow in 10 out of 10 patients.

CONCLUSION

Median arcuate ligament syndrome presents most commonly with epigastric pain or post postprandial fullness. Clinical examination and radiological investigations like CT or MR angiography or CECT abdomen form the basis of the diagnosis after excluding other possible conditions.

Early surgical intervention prevents future complications including intestinal ischemia and need for emergency laparotomy surgeries There is significant improvement in post operative blood flow based on post-operative investigations such as celiac artery doppler studies. Laparoscopic surgery has additional benefit of having shorter post operative stay, less post operative pain and more cosmetic suture line

Following laparoscopic median arcuate ligament release 90% of the patients having shown improvement in symptoms post operatively and there was complete re-establishment of celiac arteryblood flow in all 10 out of 10 patients (100%) as evident by celiac artery doppler done on post operative day 1 which marks sufficient release of median arcuate ligament.

ABSTRACT

1. To understand the need of 50 Millesimal Scale Potency when other scale of potencies were already in use.
2. To understand in depth the guidelines given by Dr. Hahnemann regarding use of 50 Millesimal Potencies, his experiences and observations regarding the same.
3. Using 50 Millesimal Scale in acute and chronic cases to appreciate the changes in patients as indicated in the 6th edition of Organon of Medicine.

INTRODUCTION

Guidelines given in the 6TH edition of Organon of Medicine by Dr. Hahnemann for 50 Millesimal Scale.

50 Millesimal Scale	Aphorism Number	Description
Preparation	270, 271	• 1 grain of 3rd trituration i.e. 3C • Dissolve it in 500 drops of a solution (100 drops alcohol+400 drops distilled water)=The Mother Potency (1:500) • Mix above 1 drop in 100 drops of alcohol & give **100 Succussions=0/1** • Soak No 10 sized 500 globules with 0/1 • Above one globule in 1 drachm vial, dissolve in 1 drop of distilled water, add 100 drops of alcohol in it & success it 100 times. This is **0/2.**
Steps to be followed for dispensing the medicine	246	• Select with all circumspection, the aptly homoeopathic medicine. • Use a highly potentised dose (50 millesimal), dissolved in water. • Every dose should be the smallest as far as possible. • ***It is very important that the degree of potency of each dose deviate somewhat from the previous & subsequent ones.*** • It should be administered after each definite period of time.

From what Potency to start	246 & 270	In both acute & chronic cases start from lowest degree of dynamization & advance is made to higher degrees as & when necessary, in gradually ever more powerful but mildly acting degrees.
Preparation of Medicinal Solution for Oral Administration	248, Footnote to Aphorism 248	**Preparation**:- • In a clean 4 oz vial with a cork, add distilled water unto 3/4th of vial. • Add 15-20 drops of alcohol for preservation. • Put 7 equal marks on it. Add only one No.10 globule of selected potency crushing it with sugar of milk in the vial.
		Direction for use:- • Before use, succuss the above vial 8, 10 or 12 times as necessary. • Then take one dose in a clean glass & again put one oz of pure drinking water in it & stir it well with a teaspoon. • Take one dose (or several tea-spoonfuls) out of it. Throw away remaining. All subsequent doses are to be taken in this way.
	272	Dry form of medicine-can be administered only in "moderate recent cases of illness"
Repetition of medicine when administered Orally	248	(i) In very urgent cases very hour or oftener. (ii) In general acute cases- after every 2-6 hours (iii) In long lasting diseases, i.e. chronic diseases-daily or every second day.

Preparation of Medicinal Solution for Olfaction	248	**Preparation:-** • Put one No.10 globule of selected medicine in a new vial of 1 oz, add a drop of distilled water to dissolve it. • Fill 3/4th of vial with alcohol. • Succuss the vial 8/10/12 times as necessary before smelling.
		Direction for use:- • After the necessary succussions, open the vial & put it near one nostril of the patient for a second or so. • Then close the vial again with the cork. • The process of succussions will have to be repeated & smell for about a second before every subsequent application. • Olfaction may be done with mouth if the nose is for any reason closed.
Repetition of Medicine when administered through Olfaction	248	For chronic cases, repeat after every 2, 3 or 4 days. For acute, may be repeated as in oral application.
2nd Prescription	248	Select another, more homoeopathic medicine if any important new ailments appear & the sympotms of the disease are altered. Newly selected medicine also is to be started from 'the lowest degrees of dynamization'.

For how long the treatment be continued	280	Continue gradually heightened doses of the most serviceable medicine which produces no new troublesome symptoms until the patient, with general improvement begins to suffer a homoeopathic aggravation.
	248-249	**ii) <u>Dissimilar aggravation-</u>** This means the first prescription was wrong. • If < is unbearable & violent, an antidote is to be applied followed by proper selection of medicine. • If < is tolerable, another medicine is to be selected & administered without delay.
Advantages	Footnote to Aphorism 246	50 Millesimal potencies can be repeated with a heightening of each dose. Cures of Chronic disease can be achieved more rapidly, using gradually increased potencies of 50 millesimal potencies.

Homoeopathic Aggravation with 50 Millesimal Potency & necessary intervention	282 281, Footnote to 248 161 157, 158	**Causes & intervention:-** **i) Similar aggravation- In Chronic Diseases:** • Largeness of Dose=Stop medicine for 2-3 days, < will disappear gradually. • Over-Sensitivity of the patient, put a tea-spoonful of the prepared medicinal solution in a 2nd/3rd or 4th glass of water depending upon the sensitivity of the patient, each such glass must be prepared fresh daily. • Over dosage of the medicine to a patient at the end of treatment when the cure is almost or quite finished=diminish the dose & frequency of the medicine, or stop it for several days. **In Acute Diseases:** • There may be slight homoeopathic aggravation (good sign) during the first hours after administration of the medicine. Don't' repeat another dose immediately.

Materials & Methods

For the Cases

A) MATERIALS:

1) Sources of Data:

• Project site: Aarihant homoeopathic medical college & RI. The cases were included from patients attending the OPD and from patients attending the OPD of the above said college hospital..

2) The Material utilized for the study:

- Specially designed case format for the study.
- Computerized Homoeopathic Software, RADAR.

3) Procuring of Medicines:

The medicines were procured from dispensary attached to Aarihant homoeopathic medical college & RI Ahmedabad Homoeopathic Medical College.

B) METHOD OF COLLECTION OF DATA:

1) Method of Sampling: Simple Random Sampling Method.

2) Number of Samples: 10 cases.

3) Selection of Cases: 10 Cases were selected based on Inclusion and Exclusion Criteria.

Inclusion Criteria:

- Both Sexes & all age groups.
- All the Socio-Economic classes.
- Both acute & chronic cases.

Exclusion Criteria:

- Patients with immune-compromised status & those on steroid therapy.
- Terminally ill patients or complicated cases with advanced & irreversible pathological conditions.
- Those presenting emergency management.
- Cases with Surgical Intervention.
- Unconscious patient.

6) Case-Taking was done according to the guidelines mentioned by Dr. Hahnemann in Organon of Medicine (Aphorism 83-104) and specially designed format for the study. Data was collected from patient, patient's attendant, physician's observation & recorded in a standardized case record.

7) Physical Examination.

8) Laboratory Investigation.

(Individualization of the case was done on the basis of the case history & clinical findings & when required, necessary investigations were carried out.)

9) Selection of Medicines:

Medicines were selected on the basis of totality of symptoms using Repertorial as well as Non-Repertorial approach, depending upon the case. For Repertorial approach Computerized Homoeopathic Software- RADAR was used.

10) Selection of Potency, Dose and Repetition:

As per the presentation of the case, potency and doses were selected (starting from 0/1) and repeated as per instructions given in 6th edition of Organon of Medicine.

11) Preparation of Medicine:

Single poppy size globule of desired 50 Millesimal Potency is to be added in 100 ml water in a glass bottle in a way that 1/4th of the bottle remains empty. This solution is called the mother solution. Each time before taking the medicine the glass bottle is succussed for 8/10/12 times as per need. Then 1-2 tsp of water is taken from the mother solution & is mixed in 30 ml of water in a glass & stirred well. 1 tablespoon of the water is to be administered to the patient & the remaining is thrown away.

12) Route of Administration of Medicine:

All the medicines were administered through Oral route.

13) Follow Up and Monitoring:

Follow up of each case was taken at interval of 3-5 days for acute cases and 7-15 days or as per the requirement depending upon the severity in chronic cases.

14) Assessment of Effectiveness:

Effectiveness of the treatment was assessed on the basis of clinical improvement, disappearance or relief of symptoms, improvement in general health and reduction in frequency of complains.

15) Results:

The result criteria were:-

- **Significantly Improved**- Disappearance of all signs and symptoms with no recurrence.
- **Moderately Improved:** Decrease in intensity and/or frequency of presenting complains with a feeling of wellbeing.
- **Not Improved:** Neither increase or decrease in the symptoms of the patient.

17) Conclusion:

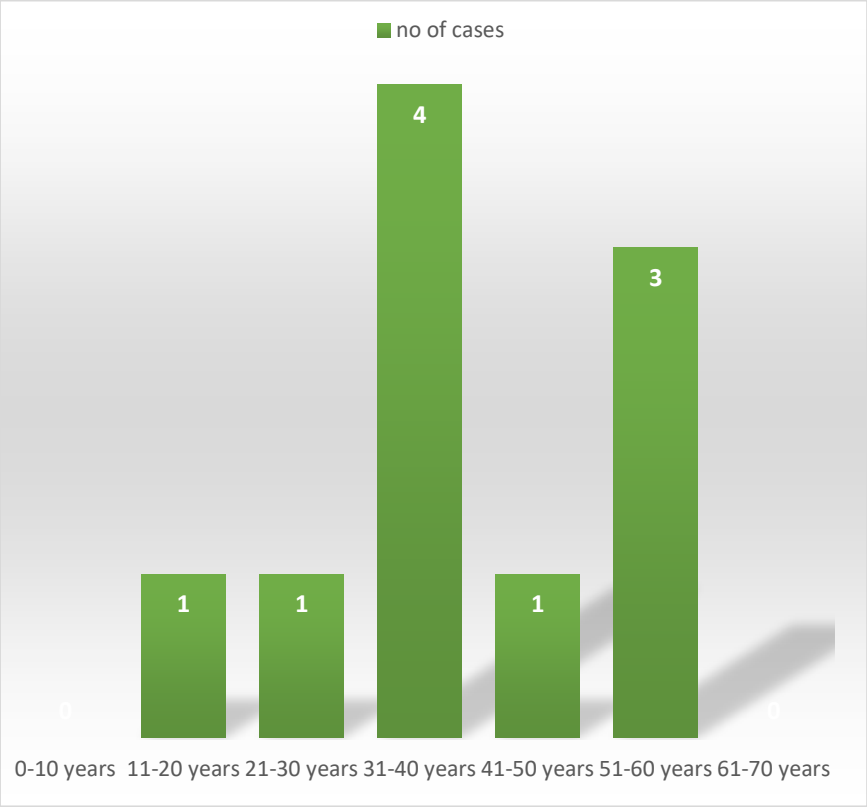
It is based on outcome of result on the basis of materials and methods.

OBSERVATION & RSULT

Table-1

Distribution of Age Group of cases related with 50 Millesimal Potencies.

Age Group in years	No. of Cases	Percentage
0-10	0	0%
11-20	01	10%
21-30	01	10%
31-40	04	40%
41-50	01	10%
51-60	03	30%
61-70	00	00%
Total	10	100%

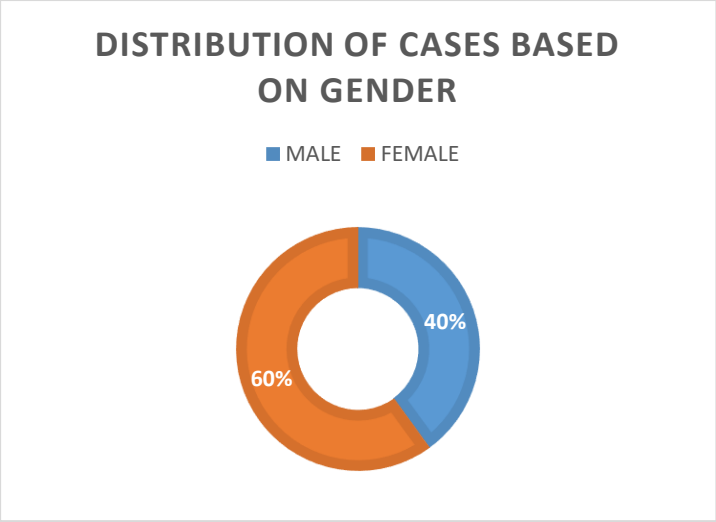


Observation: In this study, 10 cases were selected from different age groups randomly. From which, 0 cases were from age group 0-10 ; 1 from 11-20. 1 case from 21-30 age group, 4 cases from 31-40 age group, 1 from 41-50 age group, 3 from 51-60 age group and none from 61 to 70 age group.

Table-2

Gender wise distribution of Cases.

Gender	Number of Cases	Percentage
Male	04	40%
Female	06	60%
Total	10	100%



Observation: In this study, 10 cases were selected randomly. Of which 04were male & 06 were female.

Out of 04 males, 03 had significantly improved, 1 had moderately improved.

Out of 06 females, 05 females improved significantly, 01 female

Improved moderately.

Table-3

Medicines Used

Sr. no.	Medicine	No. of cases
1	Carcinosin	1
2	Calcarea Carb	1
3	Lycopodium	1
4	Natrum Mur	1
5	Arsenicum Album	3
6	Sulphur	1
7	Gelsemium	1
8	Sangunaria Can	1

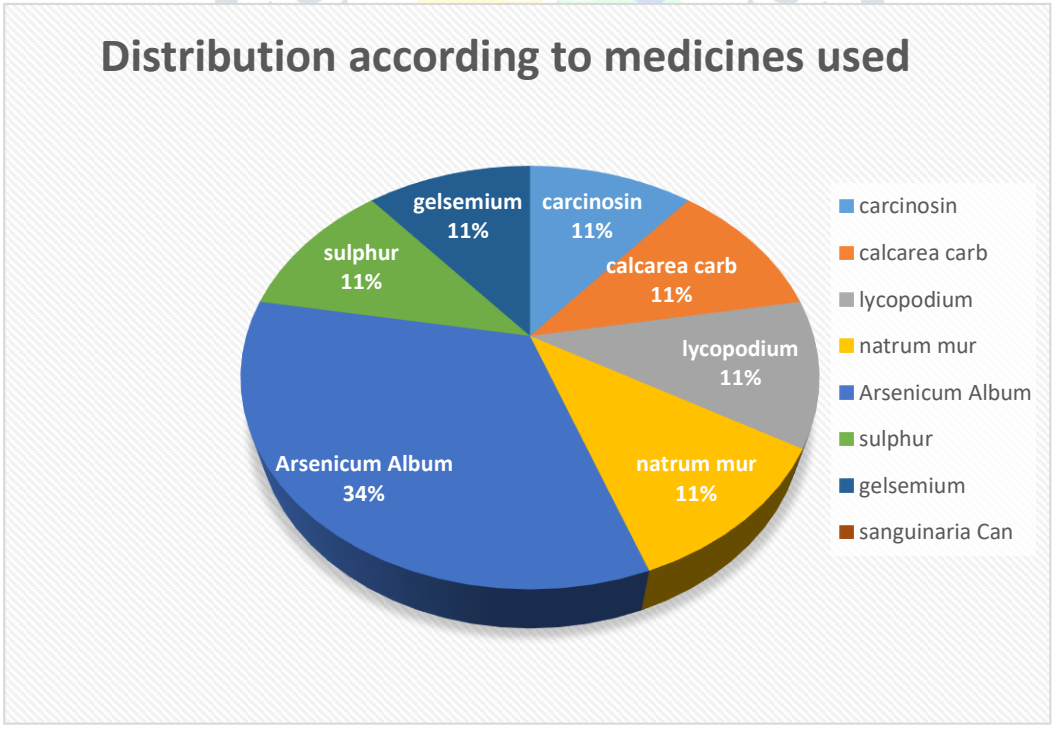


Table-4

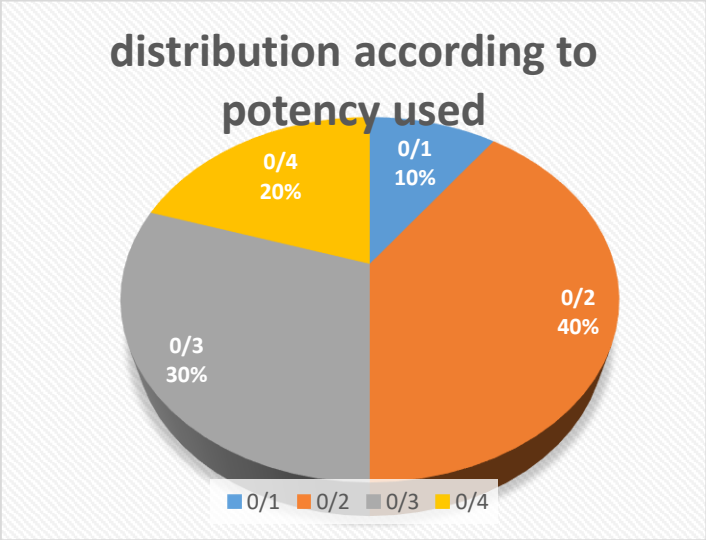
Potencies Used:

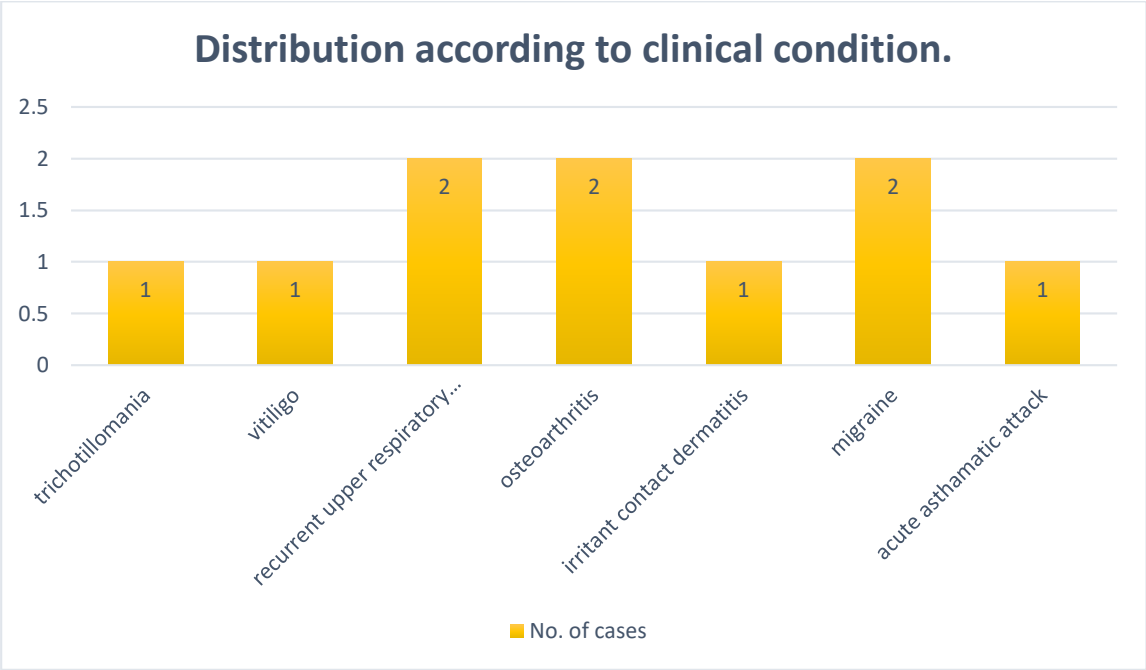


Potencies used	Number of cases
0/1	01
0/2	04
0/3	03
0/4	02

Table-5

Clinical condition based distribution

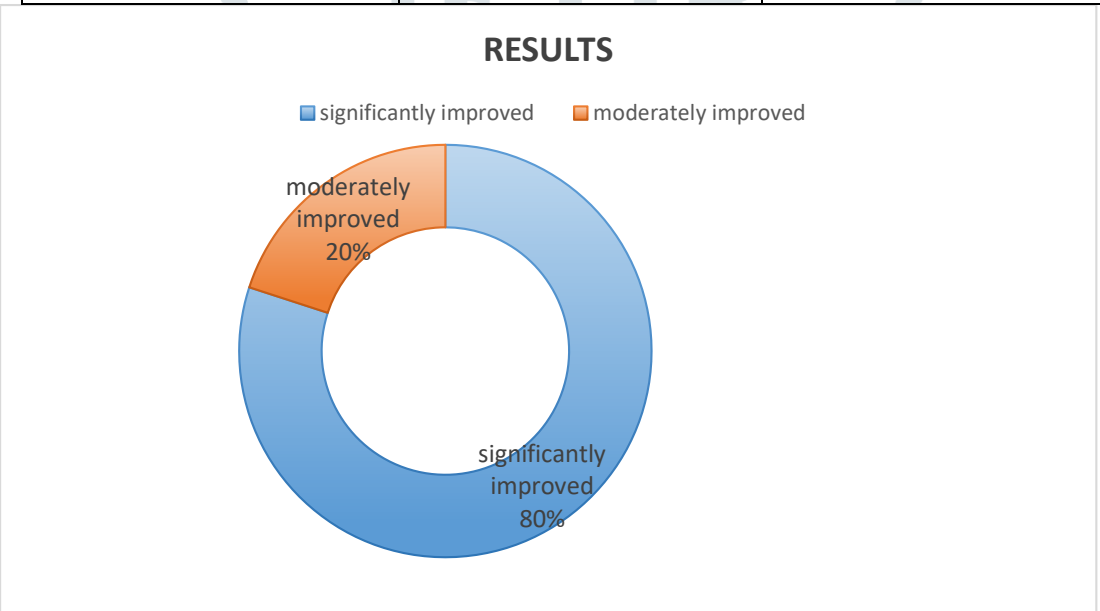
Clinical Condition	No of cases
Trichotillomania	1
Vitiligo	1
Recurrent Upper Respiratory Tract Infection	2
Osteoarthritis	2
Irritant Contact Dermatitis	1
Migraine	2
Acute Asthmatic Attack	1



Out of 10 cases– 1 case was of trichotillomania; 1 of vitiligo; 2 were of recurrent upper respiratory infection; 2 of osteoarthritis; 1 of contact dermatitis; 2 of migraine and 1 of acute asthmatic attack.

Results

	No. of Cases	Percentage
Significantly Improved	08	80%
Moderately Improved	02	20%
Not Improved	00	00%
Total	10	100%



Discussion

Cases:

The study was conducted at Aarihant Homoeopathic Medical College & RI. To understand 50 Millesimal scale potency and its current practice, total of 10 cases were selected. All selected cases were from different age groups irrespective of gender. The cases were diagnosed based on clinical presentation, investigations and follow ups were taken as per the requirement of the case. Cases were analyzed based on the age-based distribution of the results, gender-based distribution, clinical condition-based distribution, remedy distribution, potency distribution & results.

- **AGE INCIDENCE:**

In this study of 10 cases, the maximum number of cases i.e. 6 (60%), were recorded in the age group 31-40 years & the minimum number of cases i.e. 1 each (10%) were recorded in the group of 41-50 and 51-60 years respectively.

- **GENDER INCIDENCE:**

In this study, 10 cases were selected randomly. Of which 04 (40%) were male & 06 (60%) were female.

- **NUMBER OF MEDICINES USED:**

A total of 8 medicines were used based on the totality of symptoms available. They were Carcinosin, Calcarea carb, lycopodium, Natrum muriaticum, Arsenicum album, Sulphur, Gelsemium, and Sangunaria can. Amongst them Ars Alb. Ws used in more number of cases compared to the other remedies.

- **RANGE OF 50 MILLESIMAL POTENCY INCIDENCE:**

Of all the potencies, the incidence of 0/1 was 10%, 0/2 was 40%, 0/3 was 30% and 0/4 was 20%. In all the cases treatment was started with 0/1 as per Master's instructions to begin treatment with lowest degree of dynamization.

- **RESPONSE TO TREATMENT:**

-Out of 04 males, 03 had significantly improved, 1 had moderately improved.

-Out of 06 females, 05 females improved significantly, 01 female improved moderately.

- **REPETITION OF MEDICINES:**

Repetition of medicines was done as per Master's instructions.

-In Chronic cases, initially the medicines were repeated on alternate days & then once daily.

-In Acute cases, the medicines were repeated twice or thrice a day, depending upon the need of the case.

Medicines were not administered in Dry form or by Olfaction.

- **INCIDENCE OF RESULT:**

Out of 10 cases,

- 08 cases (80%) showed Significant Improvement,

- 02cases (20%) showed Moderate Improvement.

SUMMARY & CONCLUSION

To understand the 50 Millesimal Scale Potencies, I have tried to understand the journey of Master Hahnemann with his usage of crude medicinal substances from the early years of his practice to his later years where he discovered the ultra-dilutions- The 50 Millesimal Scale Potency which is a valuable part of the whole spectrum of tools to practice homoeopathy. Also, I have tried to study that if these ultra-dilutions are indeed superior, how are they been practiced today by the homoeopaths.

The journey of evolution of potencies from 'crude toxic doses of medicines' to 'ultra dilution' reflects Dr. Hahnemann's quest for the perfectly attenuated medicine, the medicine which would act as gently, as permanently, as quickly and as harmlessly as possible to cure the patient.

Dr. Hahnemann had finally released spirit from matter or energy from mass, as we would now say, achieved the transmutation which had been the goal of alchemists and chemists for thousands of years. The medicinal substance that seems to us in its crude state to be only matter, sometimes even non-medical matter, is at last completely transformed and refined by these progressive dynamization. This medicinal force by itself is no longer perceptible to the senses, but the medicated globule acts as its carrier and demonstrates its curative power in the sick organism.

10 cases, comprising both acute and chronic were studied by using 50 millesimal potency. The cases were selected randomly. Case taking and case processing was done according to the Master's instructions. The selected medicines were administered in lowest dynamization at the beginning of treatment. Repetition was done according to the ascending scale.

No aggravation had been reported in the cases which were under study. About 80% showed significant improvement, 20% showed moderate improvement.

So it can be concluded based on the above study and results that 50 millesimal Potency gives effective results and does not cause any unnecessary aggravation. But this potency it's not as extensively used in current practice as it should be, partially due to the limited knowledge regarding usage of this scale and partially due to the difficulties faced while using this scale of potency.
